The mouse does not function if Apple Hardware Test (iBook) 1.1 is used on an iMac computer with a tray-loading CD-ROM drive.
This article has been archived and is no longer updated by Apple.

Symptom

The mouse does not function if you start up an iMac computer with a tray-loading CD-ROM drive using the Apple Hardware Test (iBook) 1.1 CD, and you can't choose to restart or shut down.

Solution

Press Shift-R to restart or Shift-S to shut down.

Note: Apple Hardware Test (iBook) 1.1 only works with the Apple iBook (FireWire) computer.

Published Date: Feb 20, 2012

iMac: Static From Speakers During Dial-Up Connection

This article explains why static may be heard from iMac computers when making a dial-up connection.
This article has been archived and is no longer updated by Apple.

Symptom

After making a dial-up connection you hear a static noise coming from the computer's speakers. The sound input source has changed to Internal Modem.

Solution

1. In Mac OS 9, change the built-in input source from Internal Modem to Sound In using the Sound Strip portion of the Control Strip, or the Sound control panel.
2. Lower the computer's sound volume.
3. If you are using Internet Connect in Mac OS X 10.0, update to Mac OS X 10.1.

Notes

1. The parenthetical product descriptions (Summer 2000) and (Summer 2001) refer to the summer of the Northern Hemisphere.
2. The built-in sound input changes from the computer's current setting to Internal Modem when a dial-up connection is made so you can hear the modem connecting. This is normal. After disconnecting from the dial-up connection, the sound input source reverts to the previous setting.

PowerBook G4, PowerBook G4 (17-inch,) MacBook Pro: How to Remove or Install the Battery

- **Last Modified:** December 21, 2006
- **Article:** TA27241

- **Old Article:** 88059

This document explains how to remove or install a PowerBook G4, PowerBook G4 (Gigabit Ethernet), PowerBook G4 (DVI), or PowerBook G4 (1 GHz/867 MHz) computer's battery.

Products Affected

MacBook Pro, PowerBook G4

Notes:

- MacBook Pro, PowerBook G4 (17-inch), and PowerBook G4 (17-inch 1.33GHz) computers have a different battery location.
- These instructions do not apply to PowerBook G4 (12-inch) computers. For information on removing or installing a PowerBook G4 (12-inch) battery, see PowerBook G4 (12-inch): How to Replace the Battery.

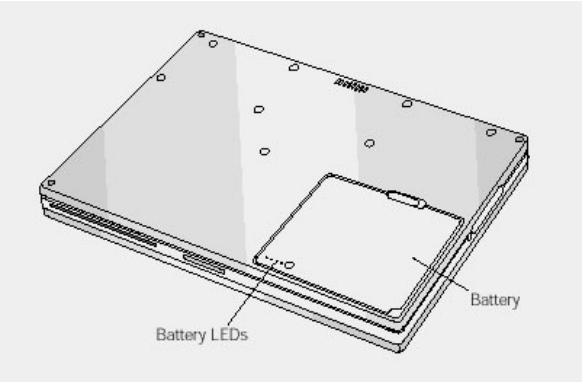

Figure 1 Battery location

Note: Appearance of computer may vary based on model.

To remove the battery

1. Shut down the computer.
2. Turn the computer over.
3. Locate the battery release latch(es).

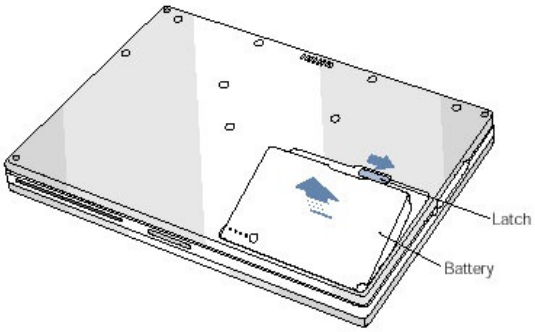

Figure 2 Removing the Battery on a PowerBook G4 Through PowerBook G4 (1 GHz/867 MHz) Computer

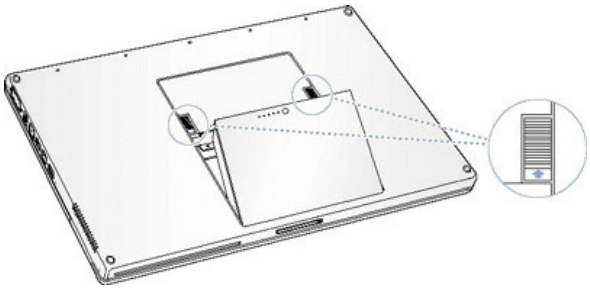

Figure 3 Removing the Battery on a PowerBook G4 (17-inch) and PowerBook G4 (17-inch 1.33GHz) Computer

4. Slide the latch down and gently remove the battery.

To insert the battery

PowerBook G4 through PowerBook G4 (1 GHz/867 MHz)

1. Insert the battery into the battery bay at an angle with the battery's LED side first.
2. Firmly press down on the battery until the battery's latch sets.

MacBook Pro, PowerBook G4 (17-inch) and PowerBook G4 (17-inch 1.33GHz)

1. Insert the battery into the battery bay at an angle with the battery's LED side last, as seen in Figure 3.
2. Firmly press down on the battery until the battery's latch sets.

To change the battery while the computer is asleep

If your battery runs low while you are working, you can put your computer to sleep and replace the battery with a charged one. The internal backup battery provides enough power to maintain the contents of memory (RAM) for about one minute. **Note:** This will not work if you are using Mac OS X 10.0.

PowerBook G4: How to Find the Serial Number

- **Last Modified:** January 08, 2007
- **Article:** TA27242

- **Old Article:** 88060

This article explains how to find the serial number on each model of PowerBook G4 computer.

Products Affected

PowerBook G4

To find the serial number using software

On most computers with Mac OS X you can find the serial number in the About This Mac window. See technical document 106486, "**Mac OS X 10.1: About This Mac Window Provides Computer Serial Number**".

To find the serial number located on the computer

If the computer is **not** on, you have to open the computer's battery bay to find the serial number. For instructions on how to remove the computer's battery please see article 88059: "**PowerBook G4: How to Remove or Install the Battery.**"

The PowerBook G4's serial number and Ethernet ID (also called a MAC address) are located on the bottom of the unit, underneath the battery, in the battery bay along one of the sides. See Figure 1.

Figure 1 Location of serial number and Ethernet ID.

PowerBook G4: Hard Drive Installation and Screw Type

- **Last Modified:** January 08, 2007
- **Article:** TA27243

- **Old Article:** 88067

This article corrects a misprint in the "Removing the Internal Hard Disk" section of some copies of the PowerBook G4 User Manual.

Products Affected

PowerBook G4

In some copies of the PowerBook G4 User Manual, the "Removing the Internal Hard Disk" section has a misprint.

Step 7 reads:

"With a Phillips screwdriver (size 1), remove the two screws that secure the hard disk carrier and then gently remove the hard disk."

The actual screw type is a Torx 8, not a Phillips (size 1).

WebObjects 4.5: How To Interpret the WOStats Page

- **Last Modified:** July 13, 2007
- **Article:** TA27246

- **Old Article:** 88074

This article discusses the meaning of the statistics shown on the WOStats page in WebObjects 4.5.

Products Affected

WebObjects

The WOStats page is useful for seeing many statistics about a WebObjects application. You can view this page in two ways. The first is through a URL such as this one:

> **http://myhost/cgi-bin/WebObjects/Myapp.woa/wa/WOStats**

where Myhost is replaced by your local host and Myapp is replaced by your application name. When using this URL, an instance is selected based on your server's load balance scheme.

The second way is to choose a specific instance by using a URL like this one:

> http://myhost/cgi-bin/WebObjects/Myapp.woa/X/wo/WOStats

where X is the number of the instance for which you want to view statistics.

For more information on accessing the WOStats page see the WOInfoCenter.

Application Statistics

Figure 1 Application Statistics

- Transaction: a transaction is one request-response loop.
- Average Transaction Time: the average time for one request-response loop to be completed.
- Average Idle Time: the time the application spends not performing request-response loops.
- Moving Average: a moving average is an average for a given sample size. The sample size is the number of transactions used to calculate the average. In Figure 1, the moving average uses a sample size of 100 transactions.
- Moving Average Transaction Time: average time for one request-response loop to be completed within the sample size.
- Moving Average Idle Time: the time the application spends not performing request-response loops within the sample size.

Session Statistics

Figure 2 Session Statistics

- Session Rate: This is the number of sessions that have timed out during the life of the application.
- Sample Size for Moving Avg: the sample size used in this section of the WOStats page.
- Avg. Transactions Per Session: average number of transactions performed in a given session.
- Current Active Sessions: the number of sessions currently active.
- Moving Avg. Session Life: the average time that a session lasts in seconds within the given sample size.
- Avg Session Life: the average time that a session has lasted in seconds while the application has been running.
- Moving Avg Transactions Per Session: average number of transactions performed in a session within the given sample size.
- Total Sessions Created: total number of sessions that this instance has created.
- Peak Active Sessions: maximum number of sessions active at one time during the life of the application.
- Peak Concurrent Session at: time and date that the peak number of session occurred.

Memory Usage (bytes) and Avg. Memory Usage Per Session (bytes)

The terms used in section of the WOStats page vary by deployment platform. See the documentation included with the operating system for a definition of these terms. Virtual and Resident memory are the terms used on Mac OS X Server.

- Memory Usage: the memory used by the instance

Figure 3 Memory Usage

- Avg. Memory Usage Per Session: the average memory used by a session in this instance. This is calculated by finding the difference between the memory footprint of the application when it starts and what it is currently. (A session is not created until a user accesses the application.) It is important to note that the first session will use more memory than other sessions because it allocates shared objects like database connections. Subsequent sessions will not consume as much memory as the first.

Figure 4 Avg. Memory Usage Per Session

Components

This section lists the components in the application, the number of times they have been served (accessed), and the time it has taken to serve each component.

Figure 5 Component Action Statistics

Direct Action Statistics

This section lists the Direct Actions in the application, the number of times they have been served (accessed), and the time it has taken to serve the Direct Action.

Figure 6 Direct Action Statistics

Detailed Statistics

Detailed Statistics shows what components are being used in relation to the other components, and how many times a component has been served. This allows the administrator to quickly see what parts of the application are being used more than others, and may help in tuning the application's performance.

Figure 7 Detailed Statistics

AirPort, AirPort Extreme: Computer Stops Responding at System Startup Time

- **Last Modified:** May 31, 2007
- **Article:** TA27248

- **Old Article:** 88076

This article describes and provides a workaround for a startup issue that can be caused when an AirPort card is incorrectly installed.

Products Affected

Power Mac G5, AirPort, iBook, Power Mac, iMac, eMac, PowerBook G4, PowerBook G3

Symptom

A computer with an AirPort card installed stops responding or "freezes" when it is turned on.

Solution

This symptom can occur if the AirPort card is not completely inserted into its connector.

For more information on properly installing an AirPort card, please see the following technical documents:

58535: "**iBook: Installing AirPort Card**"
58536: "**Power Mac G4 (AGP Graphics): Installing AirPort Card**"
58685: "**Power Mac G4 Cube: How to Install an AirPort Card**"
88058: "**PowerBook G4: How to Install an AirPort Card**"
26261: "**PowerBook G4 (12-inch): Customer Installable Parts**"
26268: "**PowerBook G4 (17-inch): Customer Installable Parts**"
86622:"**PowerBook G4: Troubleshooting Poor AirPort Extreme Performance or Issues Starting Up**"

To see a QuickTime movie about installing an AirPort card in an iBook, please see: http://www.info.apple.com/support/ibook/installairport.html

The two most common mistakes in installing an AirPort card are:

1. not completely inserting the card into its connector
2. inserting the card upside down

- Make sure the card is inserted firmly enough to allow the support clasp to secure the card into place.
- Make sure the AirPort card has been installed correctly. In G3 iBooks, the serial number side faces upward. The AirPort card is keyed to go into the slot one way. However, it is possible to force the card into the slot incorrectly, thus causing the computer to stop responding when it is turned on.

Correcting these mistakes should remedy the issue, although inserting the card upside down can result in bent pins inside the AirPort slot.

Note: Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see article 106590: "**AirPort: Requirements for Wireless Internet Access".**

PowerBook G4: Battery Fails to Charge

- **Last Modified:** December 20, 2005
- **Article:** TA27249

- **Old Article:** 88077

Products Affected

PowerBook G4

If you have a titanium PowerBook G4 with a round "puck" adapter, the battery will not charge unless the AC adapter is correctly inserted. It's possible to insert the adapter in such a way that it gets caught on the hinge and won't charge the battery.

(If you aren't sure which power adapter you have, click here for an article that shows pictures of each style. This article only applies to the round silver adapters. For help troubleshooting white "brick" style adapters, click here.)

Pay special attention when you insert the PowerBook G4 computer's AC adapter plug. When you insert the plug, make sure its nub (used to secure the plug to the circular AC Adapter) is in a horizontal position and not in a vertical position.

When you insert the plug you may feel some resistance as if the plug can go no further, but the metal part of the plug may not be fully inserted. The pictures below show an incompletely inserted plug and a properly inserted plug.

WRONG - not inserted far enough into socket

RIGHT - plug fully inserted

Press in until all of the metal on the tip of the plug is in the socket, as shown above.

PowerBook G4: Computer Shuts Down Unexpectedly

- **Last Modified:** July 01, 2004
- **Article:** TA27261

- **Old Article:** 88095

A PowerBook G4 computer may randomly or unexpectedly shut down or shuts off if the reset button is pressed or if the battery is not correctly inserted.

Products Affected

PowerBook G4

Symptom

The computer shuts down when:

- It is running and the display is opened or closed.
- It is running and is picked up or handled.
- It is sleeping and the display is opened.

Solution

- Verify the reset button is not depressed (see Figure 1).

Figure 1 Reset button in normal position

If it is depressed (see Figure 2), press a paper clip on the center of the button to dislodge it, ensure the button moves freely in the opening.

Figure 2 Reset button depressed

- Verify the battery is firmly inserted, and the battery latch is engaged.
- If the issue continues after checking the position of the button and the battery, contact Apple for further technical assistance.

Archived - AppleWorks 6.0.4: May Quit Unexpectedly When Opened in Mac OS X

If you open AppleWorks 6.0.4 in Mac OS X, the application may unexpectedly quit when attempting to create a new paint document or when checking spelling.

Products Affected

AppleWorks, Mac OS X 10.0

This article has been archived and is no longer updated by Apple.

Symptom

After opening AppleWorks 6.0.4 and clicking on the Paint module in the Starting Points palette, AppleWorks 6.0.4 quits unexpectedly. This may also occur when checking spelling.

Solution

This is a known issue with AppleWorks 6.0.4 when running natively in Mac OS X. This issue has been addressed in AppleWorks 6.1. You can locate the AppleWorks 6.1 Updater at the Apple Software Updates Web site (http://www.apple.com/swupdates/).
If the update is not yet available for your localized version of AppleWorks 6.0.4, it is possible to work around the issue by forcing AppleWorks to run in Classic. To do this, follow these steps:

1. Locate the AppleWorks 6.0.4 application.
2. Click the application's icon to select it.
3. Choose Show Info from the File menu.
4. Click to enable the "Open in the Classic Environment" option.

The next time you open AppleWorks 6.0.4 it will open in the Classic environment and should work as expected.

Note: The preview version of AppleWorks 6.1 for Mac OS X is only available for the North American English version of AppleWorks. Versions of AppleWorks 6.1 that are localized for other regions will open in the Classic environment under Mac OS X by default.

PowerBook G4: Troubleshooting: Fax Software Is Not Working

- **Last Modified:** July 01, 2004
- **Article:** TA27272

- **Old Article:** 88113

This article describes how to troubleshoot the symptom of fax software not working on a PowerBook G4 computer.

Products Affected

PowerBook G4

Symptom

Fax software is not working.

Solution

The PowerBook G4 comes with FaxSTF software installed. Apple does not provide support for this software. Please refer to the Smith Micro web site at http://smithmicro.com/support/

AppleWorks 6.1 for Mac OS X, Public Preview: Data May Be Lost When Saving Documents to an AFP File Server

- **Last Modified:** October 04, 2008
- **Article:** TA27274

- **Old Article:** 88118

Documents saved directly to an Apple File Protocol (AFP) file server, like your iDisk, from the Public Preview of AppleWorks 6.1 for Mac OS X may become unusable.

Products Affected

AppleWorks

Symptom

When you open a file an alert box appears with a message that says "Unexpected End of File". The file will never open.

Solution

This issue only occurs when saving documents directly to remote volumes connected over AFP. Save your documents to the computer's hard disk first, then copy them to the file server.

iBook (Dual USB): Mac OS X May Not Recognize External Monitor

- **Last Modified:** September 18, 2003
- **Article:** TA27276

- **Old Article:** 88123

This article discusses using external monitors with the iBook (Dual USB) computer running Mac OS X.

Products Affected

Mac OS X 10.0, iBook, Displays

Symptom

After connecting a monitor to the RGB video-out port of an iBook (Dual USB) computer running Mac OS X, the iBook does not recognize the monitor.

Solution

Install the Mac OS X 10.0.4 update. See article 75141: "**Mac OS X (10.0.4) Combined Update Information and Software**" for more information about this update.

iBook keyboard layout

- **Last Modified:** September 15, 2005
- **Article:** TA27279

- **Old Article:** 88132

Products Affected

iBook

Learn how the white iBook G3 and iBook G4 computers' keyboard layout differs from that of previous iBook computers.

The white iBook G3 and iBook G4 computers have a different keyboard layout from previous models of iBook.

White iBook G3 and iBook G4 computer keyboard layout differences:

- The layout is more symmetrical than the previous version.
- There are two Command keys, one on either side of the space bar.
- The Enter key is smaller.
- There is one Option key, to the left of the space bar.
- The keyboard latches are now located before the F1 key and after the F11 key.
- The Mute function key has been moved to F3.

For increased stability and better seating of the keyboard, engage the locking mechanism located between the F5 and F6 keys.

iBook (Dual USB): Using PowerBook G4 Adapter

- **Last Modified:** January 08, 2007
- **Article:** TA27280

- **Old Article:** 88133

You can use the PowerBook G4 AC Adapter with the iBook (Dual USB) computer.

Products Affected

iBook

The iBook (Dual USB) AC Adapter and the PowerBook G4 AC Adapter have the same electrical specifications.

You can use the PowerBook G4 AC Adapter with the iBook (Dual USB) computer. However, there is a small plastic "nub" on the PowerBook G4 AC Adapter tip that holds in the tip when the cable is wound. When a PowerBook G4 adapter is used with the iBook (Dual USB) computer, this nub can get in the way of the optical drive when ejecting a disc, as shown in Figure 1.

Figure 1 Optical drive blocked by adapter nub

When using the PowerBook G4 adapter with the iBook (Dual USB) computer, make sure that the nub does not block the optical drive. See Figure 2 for correct adapter placement.

Figure 2 Adapter nub in the proper position.

iBook (Dual USB) and later: How to find the Serial Number

- **Last Modified:** January 08, 2007
- **Article:** TA27282

- **Old Article:** 88138

Products Affected

iBook G4, iBook

This document explains how to find the serial number on each model of white iBook. For other iBooks, see document 86321, "Locating your iBook Serial Number".

To find the serial number using software

On most computers with Mac OS X you can find the serial number in the About This Mac window. See technical document 106486, "About This Mac Window Provides Computer Serial Number".

To find the serial number located on the computer

These models of white iBook are covered in this document:

- iBook (Dual USB)
- iBook (Late 2001)
- iBook (14.1 LCD)
- iBook(16 VRAM)
- iBook (14.1 LCD 16 VRAM)
- iBook (Opaque 16 VRAM)
- iBook (32 VRAM)
- iBook (14.1 LCD 32 VRAM)
- iBook (800 MHz 32 VRAM)
- iBook (900 MHz 32 VRAM)

- iBook (14.1 LCD 900 MHz 32 VRAM)
- iBook G4
- iBook G4 (Early 2004)
- iBook G4 (Late 2004)
- iBook G4 (Mid 2005)

For most of these models, the serial number may be located under the keyboard or in the battery bay. For iBook G4 (Late 2004) and most iBook G4 (Mid 2005) models, the serial number is located under the keyboard, but **not** in the battery bay. Instructions for both of these locations are listed below.

Under the keyboard

1. If the computer is on, shut it down and leave the lid open.
2. Remove the computer's keyboard. For more information on how to do this, see technical document 111917, "Keyboard Replacement Instructions".
3. The serial number and Ethernet ID (also called a MAC address) are located underneath the keyboard on the upper ledge. The Ethernet ID is located on the left side of the ledge, and the serial number is to the right.

In the battery bay

1. If the computer is on, shut it down and close the lid.
2. Turn the computer over so you are looking at the battery door.
3. Remove the battery door. For more information on how to do this, see technical document 88121, "Replacing the Battery".
4. The serial number is located on the bottom of the bay for any white iBook EXCEPT the iBook G4 (Late 2004) and most iBook G4 (Mid 2005) models.

AppleWorks 6: Cannot Locate the Microsoft Word and Excel Translators After AppleWorks 6.1.2 Update

- **Last Modified:** May 04, 2004
- **Article:** TA27285

- **Old Article:** 88150

Learn where to find Microsoft Word and Excel translators after installing the AppleWorks 6.1.2 Update.

Products Affected

AppleWorks

After installing the AppleWorks 6.1.2 Update, you cannot read and write Microsoft Word and Excel files.

If you have recently performed a clean installation and a Previous System Folder exists on your startup volume at the time you run the AppleWorks 6.1.2 Update, the translator files will be installed there instead of in your active System Folder.

Follow these steps to utilize the translators:

1. Use Sherlock to locate the MacLinkPlus for AppleWorks extension and drag it on top of the active System Folder. It will automatically be routed to the Extensions folder.

MacLinkPlus AppleWorks extension

2. Use Sherlock to locate the file DVZ C++.PPC.DLL that is in a folder named Translators. This folder is in a folder named AppleWorks. Drag this AppleWorks folder from its current location to the Application Support folder within the active System Folder.

Sherlock search for DVZ C++.PPC.DLL

3. Locate the AppleWorks folder in the Preferences folder of the active System Folder and drag it to the Trash.

Dragging folder to the Trash

4. Restart your computer.

Apple Pro Keyboard: Media Eject Key Ejects All CD/DVD Discs

- **Last Modified:** December 16, 2003
- **Article:** TA27289

- **Old Article:** 88156

The Media Eject Key on the Apple Pro Keyboard puts away and ejects all CD/DVD disc that appear on the desktop.
The Apple Pro Keyboard requires Mac OS 9.1 for the Media Eject Key to function on a Macintosh computer.

The Media Eject Key puts away and ejects all CD or DVD volumes that appear on the desktop, or are otherwise available to the computer. This includes internal CD/DVD drives as well as external USB or FireWire CD/DVD drives. Examples of media are:

- CD-ROM disc
- DVD-ROM disc
- DVD-RAM disc

Note: If multiple drives are connected with a disc in them that appears on the desktop, pressing the Media Eject Key puts away and ejects all discs.

The Media Eject Key does not eject Zip disks (external or internal) or other removable media that are not CD/DVD volumes.

Mac OS X: How to Add Hosts to Local Hosts File

- **Last Modified:** September 28, 2005
- **Article:** TA27291

- **Old Article:** 88158

This advanced document explains how to configure host information in cases where you do not have a domain name server (DNS) on the network, but need to resolve hostnames. For example, when two computers are connected with a crossover cable or a standalone hub and need to resolve hostnames, but one of the computers does not support Bonjour (formerly "Rendezvous," also known as Multicast DNS).

Products Affected

Mac OS X 10.2, Mac OS X 10.0

Mac OS X 10.2 or later

Edit the /private/etc/hosts file. For more information on how to use the hosts file, open Terminal and type: man hosts

Note: Editing this file requires root privileges.

Mac OS X 10.0 through 10.1.5

1. Open /Applications/Utilities/NetInfo Manager.
2. To allow editing the NetInfo database, click the padlock in the lower left corner of the window.
3. Enter your Admin password and click OK.
4. In the second column of the browser view, select the node named "machines." You will see entries for -DHCP-, broadcasthost, and localhost in the third column.
5. The quickest way to create a new entry is to duplicate an existing one. So select the "localhost" item in the third column.
6. Choose Duplicate from the Edit menu. A confirmation alert appears.
7. Click Duplicate. A new entry called "localhost copy" appears, and its properties are shown below the browser view.

8. Double-click the value of the ip_address property and enter the IP address of the other computer.
9. Double-click the value of the name property and enter the hostname you want for the other computer.
10. Click the serves property and choose Delete from the Edit menu.
11. Choose Save from the File menu. A confirmation alert appears.
12. Click Update this copy.
13. Repeat steps 6 through 12 for each additional host entry you wish to add.
14. Choose Quit from the NetInfo Manager menu. You do not need to restart the computer.

Note: If you have a number of hosts that you wish to add, you can use the niload command to add them. The file needs to be a standard UNIX hosts file. For instance, if you have a hosts file named "hosts.txt" you can enter the following command in Terminal to load the hosts into your local NetInfo database:

```
sudo niload hosts . < hosts.txt
```

AirPort: AirPort Base Station Does Not Work and Has Blinking Lights

- **Last Modified:** July 01, 2004
- **Article:** TA27292

- **Old Article:** 88159

This document explains what you should do if your AirPort Base Station does not respond to wired or wireless connections, a situation in which blinking amber (yellow or orange) lights (LEDs) may be visible on the base station.

Products Affected

AirPort

Symptom

Cannot connect to the base station using the AirPort Admin utility. The base station does not respond to Ethernet or wireless connections, and may have blinking amber (yellow or orange) lights.

Solution

Perform a hard reset of the base station, then reload the base station software. See technical document 58613, "**AirPort Firmware v1.0, 1.3 & 2.0: AirPort Base Station (Graphite) Forced Reload or Reset".**

Note: In addition to this solution, you need to be sure that you have connected properly to your base station and have configured the connecting computer(s) properly. Technical document 106858, "**AirPort: Troubleshooting Outline**" contains additional information that may be useful isolating your symptom to a hardware issue.

Network Assistant 4.0.x: Using Apple Network Assistant on an AirPort Network

- **Last Modified:** November 17, 2003
- **Article:** TA27294

- **Old Article:** 88165

This article explains how to set up computers with AirPort and Network Assistant.

Symptom

Using Network Assistant to observe or control client computers connected via an AirPort Base Station can result in a black screen or a communication error in the Workstation Status window.

Solution

- Make sure that all of the AirPort clients and Base Stations are updated to AirPort 1.3.1 or later and that all Network Assistant clients are updated to the latest versions of Network Assistant software, AirPort software, and the Mac OS.
- Configure the Network Assistant admin to "Only send changes made by QuickDraw" client computers when sharing screens. To select this option, choose Preferences from the Setup menu and enable the option to "Only send changes made by QuickDraw."

Figure 1 Preferences window

- Do not connect the Network Assistant admin workstation to you network via AirPort. Connect it directly to the Ethernet network to which your AirPort Base Station(s) is connected.
- Configure your AirPort Base Station to a Base Station Density of "High" and increase the multicast rate to 11 Mb using the AirPort Admin Utility. See Note 1.

Notes

1. Enabling the Base Station Density and multicast rate settings will limit the effective range of each AirPort Base Station's network and will decrease the effective distance that a client can be from that Base Station to less than 50 m.
2. Wireless Internet access requires an AirPort Card, AirPort Base Station, and an Internet service provider, for which fees may apply. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "**AirPort: Requirements for Wireless Internet Access.**"

Mac OS 9: Modem Makes No Sound

- **Last Modified:** November 17, 2003
- **Article:** TA27295

- **Old Article:** 88166

This article provides a workaround for an internal modem that does not make audible dialing or handshaking sounds.

Products Affected

Mac OS 9.2

Symptom

The internal modem makes no sound.

Solution

These solutions assume the speakers work and that you hear sounds from other sources such as an audio CD.

Mac OS 9.0 - 9.0.4

1. Open the Modem control panel.
2. Make sure the Sound option is on.
3. Open the Sound control panel.
4. Click Input.
5. Click Built-in.
6. Choose Internal Modem as the Input Source.
7. Click "Play sound through output device" to enable that option.

Mac OS 9.1

1. Open the Modem control panel.
2. Make sure the Sound option is on.
3. Open the Sound control panel.

4. Click the Input tab.
5. Select Internal Modem.
6. Click "Play sound through output device" to enable that option.

If following these steps do not resolve the issue, reset the computer's parameter RAM (PRAM).

iBook (Dual USB): Computer Stops Responding After Waking From Sleep

- **Last Modified:** October 04, 2008
- **Article:** TA27297

- **Old Article:** 88175

Activating some Mac OS X screen savers can cause the iBook (Dual USB) computer to stop responding after waking from sleep.

Products Affected

Mac OS X 10.0, iBook

Symptom

After waking from sleep, a gray or black screen appears, and the computer stops responding . This appears to occur if the screen saver was active before the computer went into sleep mode. It may also occur if the screen saver is activated after the computer has been in sleep.

Solution

Install Mac OS X 10.1.

iTunes: Working with ID3 Tags

- **Last Modified:** June 27, 2007
- **Article:** TA27299

- **Old Article:** 88186

Products Affected

Mac OS X 10.0, iTunes

This article explains how to update ID3 tags on MP3 files that contain no information, partial, or incorrect information in iTunes.

Symptom

iTunes contains no information, partial, or incorrect information in some of the fields (Song, Artist, Year, Album, Track Number, Genre)

Solution

If you want to change information in one of the ID3 Tags fields in the Library or a playlist, follow these steps:

1. Select a song by clicking it within iTunes. If you wanted to change the info for more than one song (batch), select all of the files you want to have similar information by holding down the Command key, and clicking each song to be changed.
2. Choose Get Info from the File menu, or use Command-I. This opens the iTunes Song Information window.
3. Click the "Tags" tab.
4. The Song Name field is next to the iTunes MP3 icon.
5. In the "Tags" window you can make changes to all fields shown.

Note: The Song Name field must contain information. (The Song Name field is located next to the iTunes MP3 icon.)

An alternative is to use a utility such as ID3X.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

iBook (Dual USB): External Monitor Flickers at 1024 by 768 Resolution

- **Last Modified:** October 04, 2008
- **Article:** TA27302

- **Old Article:** 88200

This document describes an issue with using external non-DDC monitors with iBook (Dual USB) computers, and provides a workaround.

Products Affected

iBook

Symptom

An external monitor connected to the computer flickers when used at 1024 by 768 resolution.

Solution

To avoid the flicker:

- Use a monitor with a Display Data Channel (DDC). Some earlier monitors may not have this feature.
- Choose a smaller resolution in the Monitors control panel, or the Monitor Resolution portion of the Control Strip.

PowerBook: Periodic CD/DVD Drive Noise

- **Last Modified:** September 16, 2003
- **Article:** TA27303

- **Old Article:** 88203

This document describes an issue with CD or DVD drives in PowerBook computers and provides a workaround.

Products Affected

Mac OS 9.2, PowerBook, PowerBook G3

Symptom

After upgrading to Mac OS 9.2.1 the CD or DVD drive periodically resets itself even if there is no disc in the drive. The reset lasts only about a second and is accompanied by a slight vibration and noise.

Products Affected

- PowerBook G3
- PowerBook G3 Series
- PowerBook G3 Series (Bronze Keyboard)
- PowerBook (FireWire)
- Mac OS 9.2.1

Solution

Download and install Authoring Support 1.1.3 or later from Apple Software Downloads (http://www.apple.com/swupdates/).

-or-

Turn off the SDAP Authoring Support extension.

1. Open the Extensions Manager control panel.
2. Click the checkbox to turn off the SDAP Authoring Support extension.

Note: This extension is not needed on this computer model unless you are using a third-party CD-RW expansion bay device.

Apple LCD Displays: How to Connect a Display With ADC to a DVI Port

- **Last Modified:** December 02, 2003
- **Article:** TA27307

- **Old Article:** 88216

This document lists third-party solutions for connecting an Apple LCD display with an Apple Display Connector (ADC) to a computer with a Digital Video Interface (DVI) port.

Products Affected

Power Mac, Displays

If you have one of these LCD displays, you may be able to connect it to a Power Mac G4 computer with a DVI port.

- Apple Cinema Display HD (ADC)
- Apple Studio Display LCD (ADC)
- Apple Studio Display 17 (LCD)
- Apple Cinema Display (ADC)

You may use the Apple DVI to ADC Adapter to connect an Apple LCD display with an ADC to a computer with a DVI port. The Apple DVI to ADC Adapter is available at the Apple Store (http://store.apple.com).

You may also check with the following companies for a possible solution.

- Gefen Inc. (http://www.gefen.com/)
- Dr. Bott (http://www.drbott.com/)

Note: The listing of these third-party manufacturers is for informational purposes only, and constitutes neither an endorsement nor a recommendation of these products.

AppleWorks 6.2: Mac OS X 10.1 Compatibility Issues

- **Last Modified:** December 16, 2003
- **Article:** TA27308

- **Old Article:** 88219

This document explains some incompatibilities with AppleWorks 6.2 and Mac OS X 10.1, and provides a workaround.

Products Affected

AppleWorks, Mac OS X 10.0

Symptom

One or more of the following symptoms appear after you upgrade to Mac OS X 10.1:

- If you open the Style window a second time AppleWorks unexpectedly quits.
- The Find/Change window may not appear or only partially appears when invoked.
- Palettes may not draw properly when monitor bit depth is set to thousands of colors.
- AppleWorks pauses and the spinning disc cursor appears for a brief period.

Solution

AppleWorks 6.2 and Mac OS X 10.1 are not compatible. Download and install the latest AppleWorks update, which is available from http://www.apple.com/swupdates/ and corrects these and other issues.

PowerBook G4: Hard Disk Does Not Appear on Desktop of FireWire Target Disk Mode Host Computer

- **Last Modified:** December 16, 2003
- **Article:** TA27311

- **Old Article:** 88224

The hard disk of a PowerBook G4 computer does not appear on the desktop or in the Finder of a host computer when it is connected using FireWire Target Disk Mode.

Products Affected

PowerBook G4

Symptom

The hard disk of a PowerBook G4 computer does not appear on the desktop or in the Finder of a host computer when it is connected using FireWire Target Disk Mode.

Solution

Update the host computer to Mac OS X 10.1.1 or later.

Mac OS X: Speech Recognition Does Not Work on Some Computers

- **Last Modified:** September 17, 2003
- **Article:** TA27313

- **Old Article:** 88229

Speech Recognition does not work on some computers with Mac OS X 10.1.

Products Affected

Mac OS X 10.1, Mac OS X 10.0, iBook, PowerBook G4

Symptom

Speech Recognition does not work on some computers when using the built-in microphone and Mac OS X 10.1. Even though Speech Recognition can be turned on in the Speech preferences pane, speakable items do not work.

Solution

Update to Mac OS X 10.1.2 or later. Use the Software Update pane of System preferences, or download the update from Apple Software Downloads (http://www.apple.com/swupdates/).

PowerBook G4 (Gigabit Ethernet): Rechargeable Battery LEDs Flicker While Charging

- **Last Modified:** December 16, 2003
- **Article:** TA27315

- **Old Article:** 88232

The slight flickering of the PowerBook G4 (Gigabit Ethernet) computer's battery LEDs is normal.

Products Affected

PowerBook G4

While the PowerBook G4 Rechargeable Battery (M8511) is being charged, the battery LEDs appear to flicker. The smart battery turns off the LEDs momentarily to improve its power reading accuracy. This is the normal operation for this battery.

PowerBook G4 (Gigabit Ethernet): Volume Control Unresponsive Past Midpoint

- **Last Modified:** December 16, 2003
- **Article:** TA27318

- **Old Article:** 88236

The volume control may seem unresponsive on a PowerBook G4 (Gigabit Ethernet) computer running Mac OS 9.2.1 when you move it past the midpoint.

Symptom

The volume doesn't change when you move the volume control slider past the midpoint in the Sound portion of the Control Strip or the Sound control panel.

Products Affected

- PowerBook G4 (Gigabit Ethernet)
- Mac OS 9.2.1

Solution

Apple is seeking a solution to this issue. The maximum volume can be reached by moving the volume slider slightly above midpoint. Moving the slider above that point has no effect.

AppleWorks 6: Stops Responding or Quits When Checking Spelling

- **Last Modified:** March 30, 2004
- **Article:** TA27321

- **Old Article:** 88247

AppleWorks may stop responding or quit when you check spelling in a word processing document that contains a spreadsheet frame.

Products Affected

AppleWorks, Mac OS 9.2, Mac OS X 10.2, Mac OS X 10.1, Mac OS X 10.0

AppleWorks may stop responding or unexpectedly quit when you check spelling in a word processing document that contains a spreadsheet frame. This issue does not occur with text or table frames.

This happens when using:

- AppleWorks 6.1.2 for Mac OS 9
- AppleWorks 6.2 for Mac OS X

This symptom will not occur if you enter the spreadsheet frame before you check spelling.

1. Double-click the spreadsheet frame to enter it for editing.
2. Check spelling.

Note: When you enter a frame, the menus and tools change to those of that type of frame. Refer to AppleWorks Help for additional information about selecting and editing frames.

iBook: Pressing F12 Does Not Open Disc Tray

- **Last Modified:** July 01, 2004
- **Article:** TA27327

- **Old Article:** 88267

The tray of the optical disc drive may not open if you have disabled the F12 eject media key.

Products Affected

Mac OS 9.2, iBook

Symptom

The tray of the optical disc drive does not open when you press the F12 eject media key.

Solution

Make sure the F12 key is set up to eject the drive tray.

1. Open the Keyboard control panel.
2. Click Function Keys. The Function Keys window appears.
3. Make sure the "Enable Hot Function Keys" and "Use F1 through F12 as Hot Function Keys" options are enabled, or "checked". See Figure 1.

Mac OS X 10.1: Cannot Install 10.1.5 (or other "10.1.x") Update

- **Last Modified:** September 17, 2003
- **Article:** TA27330

- **Old Article:** 88279

Some software updates are prerequisites for others. If you cannot install an update, check to be sure you have installed software in the correct order.

Products Affected

Mac OS X 10.1, Mac OS X 10.0

Symptom

You cannot install the Mac OS X Update 10.1.1, 10.1.2, 10.1.3, 10.1.4, or 10.1.5.

Solution

Updates to Mac OS X 10.1 must be applied in a specific order. The Software Update feature of System Preferences automatically enforces this order. To learn more about the Automatic Software Update feature, see technical document 106704: "**Mac OS X: How to Update Your Software**"

However, you may need guidance when using standalone installers. To view the required sequence of software updates, see technical document 106713, "**Mac OS X: Chart of Available Software Updates**". For example, to update from Mac OS X 10.1 to 10.1.5, you would install these software updates in this order:

1. Security Update 7-18-02 for v 10.1

2. Mac OS X Update Combo 10.1.5

Power Mac G4 (QuickSilver): Takes Several Minutes to Sleep or Wake From Sleep

- **Last Modified:** September 17, 2003
- **Article:** TA27331

- **Old Article:** 88280

A small number of Power Macintosh G4 (QuickSilver) computers may take several minutes to sleep or wake from sleep.

Products Affected

Power Mac

Symptom

When you choose Sleep from the Special menu (Mac OS 9) or Apple menu (Mac OS X) the computer takes several minutes to go to sleep. It also takes several minutes to wake from sleep.

Solution

Download and install the Power Mac G4 CD-RW Firmware Update. You can use the Software Update feature of Mac OS to download the installer, or you may download it from software download 120029: "**Power Macintosh G4 CD-RW Firmware Update: Information and Download**".

If, when you open or "run" he installer, an alert box appears with a message that says the drive is not supported or compatible, it does not mean something is wrong with the drive. The update is simply not needed or the drive has already been updated.

iMac (Flat Panel): Apple System Profiler and Memory

- **Last Modified:** July 01, 2004
- **Article:** TA27339

- **Old Article:** 88328

This document explains why Apple System Profiler reports PC-133 memory as PC-100.

Products Affected

Mac OS 9.2, Mac OS X 10.1, Mac OS X 10.0, iMac

Symptom

PC-133 memory is seen as PC-100 in the Built-in memory section of Apple System Profiler in Mac OS X 10.1 and Mac OS 9.

Solution

There is nothing wrong with the memory. While the iMac (Flat Panel) computer comes with PC-133 memory, the memory bus is 100 MHz, which causes Apple System Profiler to report the memory as PC-100.

You can verify the correct speed and latency of SDRAM installed in the factory slot by starting up the computer using Apple Hardware Test.

1. Restart your computer while holding down the C key until the "Loading" icon appears, then release the C key.
2. Click the Hardware Profile tab.
3. Under the Memory section in the upper right corner of the Hardware Profile, select the Memory slot you wish to profile. Memory #1 is the user-accessible slot. Memory #2 is the factory installed slot.

Apple LCD Displays: About the Two-Port Self-Powered USB Hub

- **Last Modified:** September 17, 2003
- **Article:** TA27342

- **Old Article:** 88359

This documents shows where the two-port self-powered USB hub is located on Apple LCD displays.

Products Affected

Displays

The two-port self-powered USB hub on the following displays is located on the back of the display, left of the display stand.

- Apple Cinema Display (20-inch)
- Apple Cinema Display
- Apple Cinema HD Display
- Apple Studio Display 17
- Apple Studio Display 15

Apple Cinema HD Display: No Startup Sound When USB Speakers Are Connected

- **Last Modified:** July 09, 2004
- **Article:** TA27343

- **Old Article:** 88363

If you plug USB speakers into the USB ports on the Apple Cinema HD Display, you will not hear the startup sound when you start up a Power Mac G4 Cube computer.

Products Affected

Power Mac, Displays

Symptom

If you plug USB speakers into the USB ports on the Apple Cinema HD Display, you will not hear the startup sound when you start up a Power Mac G4 Cube computer. All other sounds play as expected.

Products affected

- Power Mac G4 Cube
- Apple Cinema HD Display

Solution

Disconnect USB speakers from the Apple Cinema HD Display and plug them directly into the USB ports of the Power Mac G4 Cube computer.

About the PowerBook G4 and iBook Apple Video Adapter

- **Last Modified:** September 15, 2005
- **Article:** TA27346

- **Old Article:** 88395

Learn about the Apple Video Adapters used with PowerBook G4 and iBook computers.

Products Affected

iBook G4, iBook, PowerBook G4

The Apple Video Adapter allows you to connect a television or projector to your PowerBook G4 or iBook computer. The adapter has a composite video port and an S-video output port. See Figure 1. You connect the adapter to your computer using the RGB style connector. See Figure 2.

Figure 1: Composite video port is on the left, S-video output port on the right

Figure 2: RGB style connector on the other end of the adapter

This video adapter does not work with earlier iBook computers that have an RGB output port, and will not work with the original iMac (Flat Panel) computer's RGB output port. The iMac (17-inch 1GHz) and iMac (USB 2.0) computers are compatible with this adapter.

This adapter does not come with the iBook (16 VRAM) or iBook (14.1 LCD 16 VRAM) computers, but may be purchased from The Apple Store (http://www.apple.com/store/).

With the release of the PowerBook G4 (12-inch), Apple has revised the Apple Video Adapter. This Apple Video Adapter looks similar to the earlier Apple Video Adapter.

The later Apple Video Adapter model number is M9109, while the earlier Apple Video Adapter model number is M8734. Apple will no longer sell the earlier Apple Video Adapter.

It is important to use only the later Apple Video Adapter with the PowerBook G4 (12-inch), iBook G4, and iBook G4 (14-inch) computers. If you use the earlier Apple Video Adapter, the video is diminished. This diminished video could be described as out of focus and being slightly blurry.

The later Apple Video Adapter works correctly with all the previous iBooks that can use the earlier Apple Video Adapter.

This video adapter does not work with earlier iBook computers that have an RGB output port, and will not work with the iMac (Flat Panel) computer's RGB output port.

The following is a list of compatible resolutions through each port on the Video Adapter:

NTSC Resolutions

- 640 by 480 60 Hz (NTSC)
- 800 by 600 60 Hz (NTSC)
- 1024 by 768 60 Hz (NTSC)

PAL Resolutions

- 640 by 480 50 Hz (PAL)
- 800 by 600 50 Hz (PAL)
- 1024 by 768 50 Hz (PAL)

Locate the eMac serial number

- **Last Modified:** April 14, 2004
- **Article:** TA27347

- **Old Article:** 88397

Learn how to locate the serial number on an eMac, eMac (ATI Graphics) or eMac (USB 2.0) computer.

Products Affected

eMac

There are three ways to locate your eMac computer's serial number.

About This Mac (Mac OS X)

1. Choose About This Mac from the Apple menu.
2. Double-click Version. The computer's serial number appears.

Apple System Profiler

1. Click Finder in the Dock.
2. Choose Applications from the Go menu. A Finder window appears with a list of applications.
3. Locate and open the Utilities folder in the Applications folder.
4. Open Apple System Profiler. A window with information about your computer appears. The computer's serial number is located at the top of this window.

Inside the optical drive (CD or DVD) door

The serial number is located inside the optical drive door.

The serial number can be seen if you eject the optical drive tray by pressing the Eject key on the keyboard.

TA27347_Locate_the_eMac_serial_number.pdf

Eject key

Hold the door open with your left hand while pressing the Eject key on the keyboard again. The tray will retract and the serial number will be visible on the back of the drive door.

Serial number on optical drive tray

SMART: A Brief Description

- **Last Modified:** June 25, 2004
- **Article:** TA27350

- **Old Article:** 88410

This document briefly describes Self-Monitoring, Analysis, and Reporting Technology (SMART).
Self-Monitoring, Analysis, and Reporting Technology (SMART) is used to monitor and communicate the status of hard disk performance, and in some cases whether a hard drive failure is anticipated.

SMART-enabled devices monitor data such as disk calibration, CRC errors, disk spin up time, rotational speed of the disk, distance between the head and the disk, and temperature.

By regularly sampling and comparing data, SMART-enabled devices can determine the 'health' of a hard drive, which in turn can provide predictive capabilities (called Predictive Failure Analysis or PFA).

Power Mac G4 (QuickSilver 2002): Install Later NVIDIA GeForce4 Ti Drivers to Improve Performance

- **Last Modified:** July 01, 2004
- **Article:** TA27353

- **Old Article:** 88424

Install later drivers to improve the performance of the NVIDIA GeForce4 Ti graphic card.

Products Affected

Power Mac

To improve performance of the NVIDIA GeForce4 Ti graphic card, you should install the drivers listed below.

Mac OS 9

Download and install the NVIDIA Driver Update 3.0 or later for Mac OS 9. It is available from Apple Software Downloads (http://www.apple.com/swupdates/).

Mac OS X

Download and install Mac OS 10.1.5 or later. It is available from the Software Update preference pane, or as a standalone installer from Apple Software Downloads (http://www.apple.com/swupdates/).

Xserve: Qualification Information for SCSI PCI Cards

- **Last Modified:** October 04, 2008
- **Article:** TA27354

- **Old Article:** 88429

This document provides information on the compatibility of SCSI PCI cards for use in Xserve.

Products Affected

Xserve

The Apple Ultra 160 SCSI (Single Channel) PCI card, which is available as a configure to order option from the Apple Store, is the only Apple SCSI card that is qualified with Xserve. The SCSI connector is VHDCI 68 (Very High Density Cable Interconnect - 68 pins) and require a compatible cable.

SCSI cards sold or bundled with other Apple computers have not been qualified by Apple for use in Xserve.

Contact the manufacturer of your third-party card to determine if their product works with Xserve.

Archived - Xserve: Apple Display Power Buttons Do Not Turn On Xserve

If an Apple display with Apple Display Connector (ADC) is connected to an Xserve using an Apple DVI to ADC adopter, the power button on the display does not turn on the Xserve

Products Affected

Xserve

This article has been archived and is no longer updated by Apple.

Symptom

Pressing the power button on the display does not turn on Xserve.

Solution

Press the power button on the front of the Xserve.

Archived - Xserve: Ethernet Cable Difficult to Disconnect

This document explains how to remove the Ethernet cable from the Ethernet socket.

Products Affected

Xserve

This article has been archived and is no longer updated by Apple.

Symptom

When an Ethernet card is installed in the lower PCI slot on the Xserve, the cable may seem difficult to insert and remove.

Solution

The tab on the Ethernet cable connector may be covered by the chassis when the connector is installed in the lower PCI slot or the Combo slot. This can make it hard to press the tab on the connector to release the cable.

To remove the cable:

1. Insert a small, flat tool (such as a flat-nosed screwdriver) and depress the tab.

Note: Apple installs the video card in the lower PCI slot to make it easier for customers to install and use their own PCI cards in the top slot.

Xserve: How to Remotely Erase (Reformat) a Hard Disk

- **Last Modified:** December 08, 2003
- **Article:** TA27357

- **Old Article:** 88441

This document describes how to remotely reformat Xserve's hard disk.

Products Affected

Xserve

Follow the steps outlined below if you wish to reformat Xserve's hard disk, and you do not have physical access to the server.

Important: You must have the server's IP address and Admin (or root) password before performing this procedure. Xserve's default password is the first 8 characters of its serial number.

Follow these steps:

1. Log in to Xserve.
2. Type: `mount`
3. Press Return. A list of volumes that are available to the file system appears. Look for the volume that is at the root level "/". This is the server's startup volume.
For example: "/dev/rdisk0s10".
Note: You cannot reformat the startup volume.
4. Type: `umount <insert volume name>`

   For example: `umount Scratch`

5. Press Return. This makes the volume unavailable to the file system, or "unmounts" it, which is required prior to reformatting it.
6. Type: `newfs_hfs -v <insert volume name> <insert BSD device name>`

   For example: `newfs_hfs -v Scratch /dev/disk0s11`

7. Press Return. The disk is reformatted.
8. Type: shutdown -r now
9. Press Return. Xserver restarts.

Warning: Reformatting or reinitializing the hard disk erases all information stored on it. Make sure you have a backup of all files you may have created and any preinstalled software that came with Xserve.

ATI Radeon 8500 Graphics Card: Technical Specifications

- **Last Modified:** July 09, 2002
- **Article:** TA27358

- **Old Article:** 88442

This document contains the technical specifications for the ATI Radeon 8500 Graphics card.

System requirements

- AGP 4X, 2X - capable Macintosh
- Mac OS 9.2.1 or Mac OS 10.1
- QuickTime 5.0 or later
- OpenGL 1.2.2 or later

Connectors

- 15-pin VGA
- DVI-I
- S-video out

Specifications

- Radeon 8500 graphics accelerator
- 64 MB Double Data Rate (DDR) graphics memory

Display configurations

- CRT monitor
- Digital flat panel monitor
- TV
- CRT monitor and TV
- CRT monitor and CRT monitor
- Digital flat panel and TV
- CRT monitor and digital flat panel monitor

Display support

- DDC 2b/2b+ monitor support
- VESA display power management support
- Separate horizontal and vertical synchronization at tTTL levels

Features

- Full Open GL Support
- TRUFORM
- SMARTSHADER
- SMOOTHVISION (FSSA)
- HYPER Z ll
- CHARISMA ENGINE ll
- PIXEL TAPESTRY ll
- VIDEO IMMERSION ll
- High performance memory support
- Dual display support
- Integrated Transformation, Clipping and Lighting
- Twin cache architecture
- SuperScalar rendering
- Single-pass multi-texturing
- True color rendering
- Triangle setup engine
- Texture cache
- Bi-linear/Tri-linear filtering
- Line anti-aliasing
- Full-scene anti-aliasing
- Texture compositing
- Texture decompression
- Specular highlights
- Perspectively correct texture mapping
- Mip-mapping
- Z-buffering and Double-buffering
- Emboss, Dot Product 3 and Environment bump mapping
- Spherical, Dual-Paraboloid and Cubic environment mapping
- Fog effects, texture lighting, video textures, reflections, shadows, spotlights, LOD biasing and texture morphing

The following tables list the resolutions supported by the ATI Radeon 8500 Graphics card on the monitors indicated:

Resolutions on Apple Studio Display LCD
640 by 480
800 by 600
1024 by 768

Resolutions on Apple Studio Display 17 (LCD)
640 by 480

Xserve: How to Locally Erase (Reformat) a Hard Disk

- **Last Modified:** January 08, 2008
- **Article:** TA27360

- **Old Article:** 88444

This document describes how to locally reformat Xserve's hard disk.

Products Affected

Xserve

Follow the steps outlined below if you wish to reformat Xserve's hard disk, and you have physical access to the server.

Important: In order to follow these steps, you must have physical access to Xserve. You cannot perform this procedure remotely. A a keyboard and monitor must be connected to the server before you begin.

1. Start up Xserve from the Installation CD or DVD first and open Disk Utility from the first Installation screen.
2. Click the Erase tab from the Disk Utility screen.
3. Select appropriate options from this screen and click OK to begin reformatting the hard disk.

Warning: Reformatting or reinitializing the hard disk erases all information stored on it. Make sure you have a backup of all files you may have created and any preinstalled software that came with Xserve.

Xserve: How to Start Up Xserve Using an External Drive

- **Last Modified:** October 04, 2008
- **Article:** TA27361

- **Old Article:** 88445

Products Affected

Xserve

This document describes how to start up Xserve using an external drive.

Starting up Xserve from an external drive is useful when you need to run diagnostics or isolate internal CD-ROM or DVD drive issues.

Important: In order to start up the server from an external drive, you must have:

- another FireWire drive or system, such as an external FireWire hard drive, or a Macintosh computer that is capable of starting up using Target Disk Mode (for example a PowerBook or iBook)
- a version of Xserve software (Mac OS X Server 10.1.5) capable of starting up Xserve already installed on the external drive
- a keyboard and display connected to server
- physical access to the server
- a keyboard to locally select a volume

How to start up Xserve using an external drive

1. Make sure that Xserve is turned off.
2. Connect a FireWire cable between the external FireWire drive or computer and Xserve.
3. Hold down the 'T' key on the keyboard of external FireWire-capable computer while it starts up to put it into FireWire Target Disk Mode.
4. Turn on Xserve while holding down the 'Option' key on Xserve's keyboard. The Startup Manager appears.
5. Select the appropriate drive you wish to start up from in the Startup Manager window, then click the right arrow button.
6. Xserve should start up to the external FireWire drive or computer.

How to start up Xserve using an external drive remotely

1. Open the Terminal application on a remote computer.
2. Log in as an Admin user on the Xserve.
3. Type: `bless -folder /Volumes/<your drive name/System/Library/CoreServices -setOF`
4. Press Return.
5. Type: `Reboot`
6. Press Return. Xserve should start up from the external FireWire drive or computer.

Mac OS X Server 10: Unable to Connect to Server Using ssh After Erase/Reinstallation

- **Last Modified:** April 12, 2004
- **Article:** TA27368
- **Old Article:** 88461

An Administrator may not be able to connect to the server using ssh after the server software has been reinstalled due to hard drive replacement or for another reason.

Products Affected

Mac OS X Server 10.3, Mac OS X Server, Mac OS X 10.0

Symptom

The administrator can no longer administer the server remotely using ssh, and receives warnings about a possible attack. In the warning, the administrator sees reference to the RSA key no longer matching. The warning text also includes these lines:

> WARNING: REMOTE HOST IDENTIFICATION HAS CHANGED!
> IT IS POSSIBLE THAT SOMEONE IS DOING SOMETHING NASTY!
> Someone could be eavesdropping on you right now (man-in-the-middle attack)!

Solution

This is normal behavior and is to be expected. The issue occurs when the RSA key fingerprint on the server and your admin computer no longer match. Follow these steps to correct this issue:

1. On the admin computer (Mac OS X client computer), choose Go to Folder from the Finder's Go menu.
2. Type in the path name to your home folder adding /.ssh to the end of the path. example:

   `/Users/username/.ssh` where `username` is your short name.

3. Inside the .ssh folder, open the known_hosts file.
4. Locate the Servers IP and or its fully qualified Domain name and delete it and the associated characters.Example:

   ```
   example.example.com,192.104.192.118 ssh-rsa
   AAAAB3NzaC1yc2EAAAABIwAAAIEAutfhNudfF+zZ00dyrU5O7/Y1wYh+khVJTSlNLqFROuvkmsB39Y8/q47cQzdFqRfxsAlirDQKWW2xfr8qAKormuz7fT7so1myuanG24IYPwWmnZc
   ```

   Note: These characters can wrap to several lines.

5. Save and close the file.
6. Log in to the Server via shh. You will see the following message:

   ```
   The authenticity of host 'example.example.com (192.104.192.118)' can't be established. RSA key fingerprint is (followed by a large
   Hexadecimal number) Are you sure you want to continue connecting (yes/no)?
   ```

7. Type `yes`. You will then see this alert message, followed by a password prompt:

   ```
   Warning: Permanently added 'example.example.com,192.104.192.118' (RSA) to the list of known hosts.
   ```

8. Type in your administrator's password.

You are now logged in to the server. Your admin computer and the Servers RSA keys now match again.

Xserve: Status Light Overview

- **Last Modified:** September 17, 2003
- **Article:** TA27369

- **Old Article:** 88463

This document provides an overview of the Xserve status lights, what the lights indicate, and what action is appropriate.

Products Affected

Xserve

The Xserve's status lights are shown in the figure and table below.

Figure 1 Location of Xserve status lights.

Indicator	Color	Description
Power	White	On and OK
Security Lock	Yellow	Lock is engaged
System Identifier	Yellow	Indicates that someone has toggled it on or that the server has a hardware issue; check the server monitor application for more information.
Ethernet (lower LED is built-in; Upper LED is network card)	Green	Link
	No light	No connection
System Activity	Blue	Two rows of eight LEDs: on servers with one processor, rows of lights work in tandem; on dual-processor servers, rows operate independently of each other.
Drive module (Upper LED)	Green	Powered and running
	Yellow	Warning condition; check the server monitor application for more information.
	Red	Urgent issue or failure; check the server monitor application for more information.
Drive module (Lower LED)	No light	Drive can be removed
	Flashing blue	Disk activity; do not remove drive

Your USB printer doesn't appear in Print Center or is listed as unsupported

- **Last Modified:** October 04, 2008
- **Article:** TA27370

- **Old Article:** 88465

Learn what to do if USB printer connected to the computer is not listed in the Print Center, or if the Type appears as "Driver Not Installed" when adding a USB printer. This document applies to Mac OS X 10.2.8 or earlier.

Products Affected

Mac OS X 10.0, Mac OS X 10.2

This document applies if you open Print Center, click Add, select USB, and:

- The connected printer's name does not appear.
- A question mark is on the printer's icon.
- Print Center lists it as unsupported, or Type appears as "Driver Not Installed" when adding the printer.

Some printers may use custom input-output modules in the Print Center's "Printer List" pop-up menu, such as Epson AppleTalk. You may need to select one of these custom options in order to add your printer. It is also possible that your printer may be seen in the pop-up menu individually. These modules may appear in the "Printer List" pop-up menu like this:

To check the Print Center's "Printer List" pop-up menu for your specific printer:

1. Open Print Center (/Applications/Utilities/).
2. Click Add Printer in the Print Center.
3. Select the appropriate connection method from the pop-up menu (for example, USB, EPSON USB, Epson AppleTalk, and so forth).
4. When you see the printer's name in the pop-up menu, select it.
5. Click Add Printer.

If you cannot find the printer you want to add in the list of connection methods, verify that:

- The printer's software has been installed.
- You are choosing the right connection type for your printer.
- The printer is connected to your computer, plugged in, and turned on. If you have selected the right connection type for your printer from the pop-up menu within the Printer List window, and the printer is reported as unsupported or driver not installed, check for an updated software version at the manufacturer's website or the Mac OS X downloads page.

Macintosh: Clipboard Uses Application's Memory Partition

- **Last Modified:** June 08, 2007
- **Article:** TA27379

- **Old Article:** 9167

With Mac OS 9 and earlier, the Clipboard uses an application program's available memory. Therefore, you cannot copy data to the Clipboard that uses more memory than is available within the application.

Products Affected

Mac OS 9.2, Mac OS 8.6, Mac OS 8, Mac OS 8.1, Mac OS 8.5

When data is copied to the Clipboard, the information is stored within the application program's memory partition. An "out of memory" message when copying data to the Clipboard indicates that there is not enough memory available in the application's memory partition to perform the operation. Consider this simple example:

An application has been assigned a 5 MB memory partition, and uses 2 MB to open and operate. Therefore, 3 MB remains available for data and documents. If a document is opened that uses 2 MB of the application's available memory, then 1 MB is all that is available for use by the Clipboard. Attempting to copy more than 1 MB of data to the Clipboard while using this application results in an "out of memory" error message.

Follow these steps to see how Clipboard usage affects an application's memory:

1. Open your application.

2. Open a document with a large amount of data (a complex image, or a lengthy text passage, or a video clip).

3. Choose Finder from the Application menu.

4. Choose About This Computer from the Apple menu (see Figure 1). Position this window so that it is still visible when using your application.

Figure 1 About This Computer

5. Notice the memory usage bar for your application program. The filled-in portion of the bar represents the amount of memory currently being used by the application. (Choose Show Balloons from the Help menu, then point to the memory usage bar for an exact number.)

6. Choose your application from the Application menu.

7. Select a large amount of data in the document that you have opened.

8. Choose Copy from the Edit menu of your application. Notice how the memory bar changes; the Clipboard is using the application's memory to perform the operation.

You can increase the memory available to an application (and therefore to the Clipboard when using that application) by assigning more memory to the application. Mac OS Help, available on your Macintosh, can guide you through this process. Or, see article 18278: "**Mac OS: Assigning More Memory to an Application Program**"

iMovie 3: Trash Does Not Empty

- **Last Modified:** November 12, 2007
- **Article:** TA27380

- **Old Article:** 93001

When you empty the Trash in some iMovie projects, the Trash may initially indicate it is empty, but may again indicate there are items in it the next time you open the project.

Products Affected

iMovie

Symptom

When you empty the Trash in an iMovie 3 project, the Trash indicator initially reads as 0 KB. When you reopen the project later, the items you previously emptied return, and the Trash indicator is greater than 0 KB.

Solution

Update to iMovie 3.0.3 or later.

Copyright © 2009 Apple Inc. All rights reserved. Terms of Use | Privacy Policy

iMovie: Titles or Still Pictures Appear Pixelated

- **Last Modified:** April 03, 2007
- **Article:** TA27381

- **Old Article:** 93002

To minimize pixelation in iMovie, update to iMovie 3.0.3 or later and QuickTime 6.3 or later.

Products Affected

iMovie, QuickTime

Some pixelation within iMovie is expected. For best results, update to iMovie 3.0.3 or later and QuickTime 6.3 or later. (Pixelation is when the picture looks blocky, blurry, or grainy.)

The Preview window within iMovie is an approximation of final output. Pixelation in the preview window and in full-screen preview within iMovie is normal. However, pixelation should not be visible when the project is output to DV tape or DVD.

For best results, make sure any still images you import into your iMovie project are at least 640- x 480-pixels in size.

You may be able to achieve sharper output to QuickTime by using the Expert export options in the QuickTime pane of the Share panel, rather than using the QuickTime presets provided by iMovie. MPEG-4 for example, can provide a small file with a high quality, sharp output.

Follow the steps for the version of iMovie you have.

iMovie 3.0.3 or earlier

1. From the **File** menu, choose **Export**.
2. From the **Export** pop-up menu, choose **QuickTime**.
3. From the **Formats** pop-up menu, choose **Expert Settings**.
4. Click the Export button.
5. Enter a name for your output file, and select a save location.
6. from the **Export** pop-up menu, choose **Movie to MPEG-4**
7. From the **Use** pop-up menu, choose one of the following qualities:
    - LAN/Intranet is lowest compression/highest quality
    - Dial-up is highest compression/lowest quality

iMovie 4 or later

1. From the **File** menu, choose **Share**.
2. Click the QuickTime icon.
3. From the pop-up menu, choose **Expert Settings**
4. Click the Share button.
5. Enter a name for your output file, and select a save location.
6. from the **Export** pop-up menu, choose **Movie to MPEG-4**
7. From the **Use** pop-up menu, choose one of the following qualities:
    - LAN/Intranet is lowest compression/highest quality
    - Dial-up is highest compression/lowest quality

If you don't see an MPEG-4 option, check to make sure you have updated to the latest version of QuickTime. You can also experiment with the different Expert Settings options to find the quality and compression combination that works best for your purposes.

High Quality option

For projects output to QuickTime, the compression format you select for the final output may cause some pixelation in the QuickTime movie. You may also want to set the high quality flag on the movie to improve image clarity on playback in QuickTime Player.

Note: These steps require QuickTime Pro for QuickTime 6 or earlier, which you can purchase at the QuickTime website. If you have QuickTime 7, QuickTime Pro is not required.

To turn on the high quality option in QuickTime Player:

QuickTime 7 (without QuickTime Pro)

1. Open QuickTime Player.
2. From the **QuickTime Player** menu, choose **Preferences**.
3. Click the General button.
4. Check the "Use the high quality video setting when available" checkbox.

5. Close the Preferences window.

QuickTime 7 (with QuickTime Pro)

1. Open the QuickTime movie you created in QuickTime Player.
2. From the **Window** menu, choose **Show Movie Properties**.
3. Click to select the Video Track.
4. Click the Visual Settings tab.

5. Click to check the option for "High Quality".
6. Close the properties window.
7. Save your movie to record the change in playback quality (Command-S).

QuickTime 6 or earlier (with QuickTime Pro)

1. Open the QuickTime movie you created in QuickTime Player.
2. From the **Movie** menu, choose **Get Movie Properties**.
3. From the **Movie** pop-up menu in the Properties window, choose **Video Track**.
4. From the other pop-up menu in the Properties window, choose **High Quality**.

5. Click to check the option for "High Quality Enabled".
6. Close the properties window.
7. Save your movie to record the change in playback quality (Command-S).

iTunes 4: How to Keep the Music Store From Appearing

- **Last Modified:** February 02, 2004
- **Article:** TA27382
- **Old Article:** 93003

Learn how to keep the Music Store from appearing in the iTunes Source list.

Products Affected

iTunes Store, iTunes

Following these steps to hide the Music Store from the iTunes Source list.

1. Open iTunes.
2. From the **iTunes** menu, choose **Preferences** (Windows: From the **Edit** menu, choose **Preferences**).
3. Deselect the "Show iTunes Music Store" option.
4. Click OK to close the Preferences window.

iSync 1.5: How to back up and restore your data

- **Last Modified:** January 05, 2007
- **Article:** TA27383

- **Old Article:** 93004

Products Affected

.Mac, iSync

This document explains how to use iSync 1.5 to back up data that you sync.

iSync provides an easy way to back up and restore synchronized data. The Back Up My Data command in the Devices menu creates a copy of the data from the last sync. When you choose this command, iSync creates a duplicate of the Last Sync Data. The Backup folder content changes when you choose the Back Up My Data command and there are changes to your data. You can also use the Revert to Backup and Revert to Last Sync commands to restore your data.

You can use Address Book's Backup command and iCal's Export command, too. If you're a .Mac (pronounced "dot Mac) member, you can use the Backup application that comes with your membership to back up your Address Book and iCal data. For more information, search Mac Help for "backing up Address Book" or iCal Help for "exporting." For information about joining .Mac, visit the Mac.com website (http://www.mac.com) or see the .Mac Learning Center.

To back up your data using iSync

1. Open iSync.
2. From the **Devices** menu, choose **Back Up My Data**. The latest version of your application data is now backed up.

Note: You will not see any notification that a backup has been performed.

To restore your data from the most recent backup

1. Open iSync.
2. From the **Devices** menu, choose **Revert to Backup**. You will be warned that any changes made to the computer or any device since the backup will be lost.
3. Click the Revert to Backup button to continue. Your data will be restored from the most recent backup. Should you wish to not proceed with the Revert to Backup, click Cancel. Clicking Cancel will not change your data.

If you are registered with .Mac, this will also restore your backed up application data to .Mac. After this, you could restore any other computers syncing with the same .Mac account.

To Restore your data from the most recent sync

1. From the **Devices** menu, choose **Revert to Last Sync**. You will be warned that any changes made to the computer or any device since the last synchronization will be lost.
2. Click the Revert to Last Sync button to continue. Your data will be restored from the most recent sync. Should you wish to not proceed with the Revert to Last Sync, click Cancel. Clicking Cancel will not change your data.

iTunes 4: Troubleshoot Purchased Songs From the iTunes Store

- **Last Modified:** May 07, 2007
- **Article:** TA27385

- **Old Article:** 93011

This document discusses possible issues that might occur when purchasing songs from the iTunes Store.

Products Affected

iTunes Store, iTunes

If you're not able to buy music from the iTunes Store, check the following:

- Make sure there isn't an issue with the information in your Apple ID account. To verify or correct your Apple ID information follow these steps:
  1. Open iTunes.
  2. Sign in to the iTunes Store.
  3. Click the Account button and view your account information.
  4. Click Edit Account Info and Edit Billing Info and verify that the information is accurate and complete.

- Make sure you don't have any previous purchases that could not be processed using the information in your Apple ID. If you see a message that you need to contact Apple Support to correct an issue with a previous purchase, you won't be able to buy any music until you correct the issue as indicated in the message.
- Make sure the iTunes Store is available in your country. For more information, visit **http://www.apple.com/itunes/** .
- Make sure there's nothing wrong with your Internet connection. Visit a different website to verify your connection. If you are able to connect to other sites, there may be an issue with the iTunes Store. Try visiting the store again later.

For additional assistance see the iTunes Customer Service page and select the appropriate topic (select your country first on the right side). If necessary, you can submit a question to the iTunes Customer Service team.

iTunes 4: How to View Album Artwork

- **Last Modified:** December 17, 2003
- **Article:** TA27386

- **Old Article:** 93018

This document explains how to view album artwork in iTunes 4.

Products Affected

iTunes Store, iTunes

If you've purchased music from the iTunes Store or added any artwork to the songs in your library, you may be able to see artwork for the currently playing or selected song:

- To see the currently selected or currently playing song's artwork (if available), click the Artwork button in the lower-left corner of the iTunes window. **Note**: If the song has more than one piece of artwork associated with it, you can click the arrows that appear to see additional artwork.
- Click the song artwork in the iTunes window to see the expanded artwork. **Note**: The zoom button in the expanded artwork window toggles the artwork between 100 percent and 150 percent.
- To switch between seeing the art for the currently playing song and the art for the currently selected song (if available), click Now Playing or Selected Song (whichever is visible) above the artwork area. If you don't see the Now Playing or Selected Song titles, click the Artwork button in the lower-left corner of the iTunes window.
- To see the artwork in its own window, double-click the song artwork.

Note: The artwork button is disabled when the iTunes Store is selected.

QuickTime 6.2 or later required for other applications to play purchased music

- **Last Modified:** October 10, 2005
- **Article:** TA27389

- **Old Article:** 93022

QuickTime 6.2 or later is required for iPhoto and iMovie to play music purchased from the iTunes Store.

Products Affected

iMovie, iPhoto, iDVD, iTunes Store, QuickTime, iTunes

Songs purchased from the iTunes Store play in iTunes but do not play in the iPhoto Slide Show or in iMovie. An alert with a message like this may also appear: "Error during audio playback. The file "/Users/karine/Music/iTunes Music/12 Hound Dog.m4p could not be played because it could not be found; QuickTime couldn't parse it (-2048)".

This happens when using:

- iTunes 4
- iPhoto
- iMovie
- iDVD
- QuickTime 6.1.1 and earlier

The solution is to download and install QuickTime 6.2 or later. The latest version of QuickTime is available from the QuickTime website. iPhoto and iMovie require QuickTime 6.2 to use songs purchased from the iTunes Store.

iTunes: iTunes Store - Purchasing songs with 1-Click

- **Last Modified:** February 19, 2007
- **Article:** TA27390

- **Old Article:** 93024

Learn how to purchase songs using 1-Click in the iTunes Store.

Products Affected

iTunes Store, iTunes

If you're connected to the Internet and have an Apple Account, you can buy individual songs or entire albums from the iTunes Store.

By default, music is purchased using 1-Click. With 1-Click, the music you buy is immediately charged to the credit card listed on your Apple Account, downloaded into your iTunes library, and placed in a Purchased Music playlist.

To buy a song or album with 1-Click:

1. From the **iTunes** menu, choose **Preferences**. (Windows: From the **Edit** menu, choose **Preferences**).
2. Click the Store button at the top of the window.
3. Make sure "Buy and download using 1-Click" is selected and click OK.
4. Click iTunes Store in the Source list, then find the song or album you want to buy.
5. Click Buy Song or Buy Album.

Important: Once you click "Buy Song" or "Buy Album" you have purchased the music. You cannot undo the purchase.

iTunes: Some AAC files won't play

- **Last Modified:** May 15, 2007
- **Article:** TA27391

- **Old Article:** 93025

Products Affected

iTunes Store, iTunes

Learn why an AAC format file may not play in iTunes 4 or later.

There are some reasons why a song in AAC format may not play in iTunes 4 and later.

- If you can't play a song (AAC format) that you purchased from the iTunes Store, you may have exceeded the number of computers you can use to listen to your music purchases. The limit is five for digital rights management (DRM) protected music.
- If you're listening to a shared library or playlist, iTunes skips any purchased music in the list (if your computer is not authorized to play the music). To listen to a purchased song in a shared library or playlist, double-click the song. If your computer is not authorized to play songs purchased by the person who is sharing the song, you'll need to enter that person's Apple ID and password to hear the song.
- AAC-encoded songs that were not created with iTunes or downloaded from the iTunes Store, may not play in iTunes. Use iTunes 4 or later to encode the song from an audio CD.

iTunes: iTunes Store Connection Speed

- **Last Modified:** February 19, 2007
- **Article:** TA27392

- **Old Article:** 93026

This document discusses the network capabilities recommended for downloading and previewing songs in the iTunes Store.

Products Affected

iTunes, iTunes Store

For best results, your network connection should be able to download at 128 kilobits per second (kbit/s) or faster, particularly when listening to previews of songs. A DSL, cable modem, or local area network (LAN) Internet connection is recommended.

iTunes: About iTunes Store Parental Advisories

- **Last Modified:** September 21, 2006
- **Article:** TA27395

- **Old Article:** 93031

Products Affected

iTunes Store, iTunes

This document describes the Parental Advisory Label that appears on some selections available in the iTunes Store.

Advisory for Internet radio: The stations available using the iTunes radio do not originate from Apple. Some may broadcast material for mature audiences, such as songs with explicit lyrics and comedy broadcasts with adult themes and situations.

Advisory for the iTunes Store: The following is derived from the Recording Industry Association of America Parental Advisory website. The Parental Advisory is a notice to consumers that recordings identified by this logo may contain strong language or depictions of violence, sex, or substance abuse. Parental discretion is advised.

The use of the Parental Advisory Label is not a determination of whether a recording is or is not appropriate for particular listeners. Rather, the non-removable label is a "heads up" to parents (and consumers, retailers, and wholesalers) that parental discretion is advised when purchasing the particular recording for children or when listening to the recording in the home.

The following issues may have been considered in making a determination regarding application of the label.

- Whether, in light of contemporary cultural morals and standards and the choices and views of individual parents, the recording might be one that parents may not want their child to listen to.
- Context is obviously important: Some words, phrases, sounds, or descriptions might be offensive to parents if spotlighted or emphasized, but might not offend if merely part of the background or not a meaningful part of the lyrics.
- The context of the artist performing the material, as well as the expectations of the artist's audience, is also important. In addition to profanity, "depictions of violence, sex, or substance abuse" must be considered when making a determination regarding the application of the Parental Advisory Label.
- Lyrics are often susceptible to varying interpretations. Words can have different meanings. Also, words cannot be viewed in isolation from the music that accompanies them. Lyrics when accompanied by loud and raucous music can be perceived differently than the same lyrics

when accompanied by soft and soothing music.

Labeling is not a science; it requires sensitivity and common sense. Context, frequency, and emphasis are obviously important; isolated or unintelligible references to certain material might be insufficient to warrant application of the label.

These guidelines apply to the case of a single track commercially released as well as to full albums (whether released in the form of a CD, cassette or any other configuration) and videos.

For more information on parental controls, please see "iTunes: Using Parental Controls."

iTunes 4: About iTunes Store Song Bitrate

- **Last Modified:** December 09, 2003
- **Article:** TA27396

- **Old Article:** 93034

This document describes the bitrate for the songs available from the iTunes Store.

Products Affected

iTunes Store, iTunes

Purchased songs are encoded using MPEG-4 Advanced Audio Coding (AAC) format, a high-quality format that rivals CD quality.

Songs purchased and downloaded from the iTunes Store are AAC Protected files and have a bitrate of 128 kilobits per second (kbit/s).

The purchased song should sound as good as or better than a 160 kbit/s MP3 file. Because the bit rate is lower, though, the AAC file takes less disk space than the MP3 file.

QuickTime: About the QuickTime 6.0.3 Update For Mac OS 9

- **Last Modified:** September 17, 2003
- **Article:** TA27397

- **Old Article:** 93038

The QuickTime 6.0.3 Update updates and enhances QuickTime for Mac OS 9 and Classic. This software updates QuickTime 6.0, or 6.0.1, or 6.0.2 to QuickTime 6.0.3.

Products Affected

Mac OS 9.2, QuickTime

Installation

QuickTime 6.0.3 for Mac OS 9 is only available as a standalone installer. **Note**: The QuickTime Updater application will not update to this version.

The standalone installer is available from the QuickTime website (http://www.apple.com/quicktime/).

Enhancements included with the 6.0.3 update

- Allows text files larger than 32 KB to be imported.
- Improves playback of movies under Classic in Mac OS X

Enhancements included with the 6.0.2 update

- Enhances the security of QuickTime software updates and downloads
- Improves the stability and performance of exporting audio
- Enhances the performance of MPEG-4 playback
- Improves MPEG-4 recording and streaming

iTunes 4: Encode From Original Masters

- **Last Modified:** September 17, 2003
- **Article:** TA27398

- **Old Article:** 93040

Converting a file from one compressed format to another compressed format can lead to quality loss.

Products Affected

iTunes

Compression algorithms such as MP3 and AAC are intended for use with original source material (audio CD, tape, LP, or AIFF file). They are typically not intended for recompressing a file that was already compressed. A loss of quality can occur if you convert any sound file from one compressed format to another.

If you want to convert your library from MP3 to AAC, for example, you will gets best results by re-encoding songs and other sound files from the original source media.

Important: iTunes software may be used to reproduce materials. It is licensed to you only for reproduction of non-copyrighted materials, materials in which you own the copyright, or materials you are authorized or legally permitted to reproduce. If you are uncertain about your right to copy any material you should contact your legal advisor.

iMovie 3.0.3: Pressing the Delete Key Doesn't Delete Clips or Audio

- **Last Modified:** November 18, 2003
- **Article:** TA27413

- **Old Article:** 93149

If your computer's keyboard has an F13 key, press Backspace instead of Delete to deleting audio or video clips in iMovie 3.0.3.

Products Affected

iMovie

Symptom

The "del" key below F13 will not work with iMovie.

Solution

For most keyboards, pressing the Delete key located below the F11 and F12 keys removes audio or video clips from your iMovie project.
If your keyboard doesn't have a Delete key, or if pressing the Delete key doesn't work, press the Backspace key instead.

Additional information

The "del" key is sometimes referred to as the "Forward Delete" key.

This document contains information from the iMovie 3.0.3 Late Breaking News

Final Cut Pro 4: Late-Breaking News

- **Last Modified:** June 13, 2007
- **Article:** TA27416

- **Old Article:** 93157

This document contains late-breaking information about Final Cut Pro. For the latest information about product updates, tips and techniques, and qualified third-party devices, visit the Final Cut Pro website (http://www.apple.com/finalcutpro/).

Products Affected

Final Cut Pro

Late-Breaking Features

Automatic Naming of Captured Clips No Longer Uses Zeroes
Automatic naming of captured clips in Final Cut Pro 4 has been updated to remove extra zeroes from the beginning of a clip number. For example, in previous versions of Final Cut Pro, a series of clips would automatically be named and numbered as follows: Untitled 0001, Untitled 0002, Untitled 0003. The extra zeroes in front of the number ensured that the clips would remain in sequential order once the clips reached 0010 and 0100 respectively. Final Cut Pro 4 no longer requires the extra zeroes in order to sort effectively. Now, clips are automatically named and numbered as follows: Untitled 1, Untitled 2, Untitled 3.

Additional Settings Available in the Batch Capture Window
In the Batch Capture window, when you select the Use Logged Clip Settings checkbox, additional settings are included for the captured clips:

- Image and Gain settings (for analog capture)
- Capture settings from the Capture pop-up menu
- Audio settings from the Audio Format pop-up menu

Note: These settings are found in the Clip Settings tab of the Log and Capture window. New Sequences Are Created With One Video and Four Audio Tracks New sequences are now created by default with one video and four audio tracks. You can change this in the Timeline Options tab of the User Preferences window.

Creating Duplicate Master Clips in the Browser
To create a new master clip instance of a clip in the Browser, press Option while dragging a clip from the Timeline into the Browser, then press Command. When you see a cursor with M+ next to it, this indicates that a new master clip is being created; you can release the keys.

Using the Timecode Print Filter
When you use the Timecode Print filter, and choose Reader from the Mode pop-up menu in the Filters tab, the media/source timecode is displayed. This filter is located in the Effects tab of the Browser, within the Video Filters bin, in the Video Filter bin.

New Filters Improve Chroma Keying With DV-25, DVCPRO-50, and Uncompressed Video
Two new color filters (in the Key bin within the Video Filters bin) are available to aid in chroma keying video clips in Final Cut Pro. The Color Smoothing - 4:1:1 filter improves the quality of chroma keys performed with DV-25 video clips. The Color Smoothing - 4:2:2 filter improves the quality of chroma keys performed with DVCPRO-50 and 8- and 10-bit uncompressed 4:2:2 video clips.

To improve the quality of your chroma key, apply the appropriate smoothing filter to the clip you want to chroma key first. As you add additional keying filters, make sure that the Color Smoothing filter you've used remains the first one in the video section of the Filters tab.

Note: These filters may, in some instances, also be used to smooth out diagonal "stairstepping" that can occur in video clips with areas of high-contrast color.

Applying Filters to Multiple Tracks
When you apply a filter to a clip in a sequence, it's applied to all clips in tracks that have Auto Select turned on, just as if you'd used the Range Selection tool. However, filters are applied to the entire clip regardless of whether In and Out points are set.

Add Edit Command Works on Auto Select Tracks
The Add Edit command (Control-V) in the Sequence menu works like the Razor Blade tool, adding an edit point to all clips in the Timeline at the current position of the playhead. This command works on all tracks with Auto Select turned on.

Using the Make Independent Clip Command
As a result of the relationship between master and affiliate clips, changes made to certain properties of a master clip, such as Clip Name, Reel Name, or Timecode are automatically made to all affiliated clips within the current project. These same changes, if made to an affiliate clip, are also made to that clip's master clip, as well as to all other affiliated clips in the current project.

The online or offline state of clips is also automatically updated among all affiliated clips in a project, all at once. Suppose you open a project in which all the clips are offline. Relinking that project's master clips in the Browser automatically relinks all the affiliate clips that appear in each of that project's sequences. Depending on your project, you may choose to sever an affiliate clip from its master. This prevents the affiliate clip from updating with its master clip and other affiliate clips.

To make an affiliate clip in a sequence independent:

- Control-click the affiliate clip in the Timeline, then choose Make Independent Clip from the shortcut menu. Your affiliate clip is now an independent clip. Any changes you make to this clip do not affect the master clip.

New Dynamic Trimming Option Added to Trim Edit Window
The Trim Edit window now has a Dynamic checkbox that you can use to toggle dynamic trimming on and off, without having to go to the User Preferences window. This checkbox is located at the bottom of window, between the -1 and +1 Trim buttons.

New Sequence Audio Option For Trimming
You can now choose if want to hear a sequence's audio when doing a trim edit. The Trim with Sequence Audio checkbox is located in the General tab of the Preferences window, below the Dynamic Trimming option; this option is enabled by default. If the checkbox is enabled, you hear the sequence audio when trimming; if the checkbox is disabled, you hear the linked audio (similar to earlier versions of Final Cut Pro).

Asymmetrical Trimming
Asymmetrical trimming allows you to ripple edit opposing video and audio edit points in opposite directions to create split edits. Asymmetrical trimming can be done either in the Timeline or in the Trim Edit window. To trim an edit asymmetrically:

1. Select the Ripple tool.
2. Hold down the Option key, then click the In point of an incoming video clip to select it. Holding down the Option key while selecting an edit point selects only that point, ignoring any other items linked to that clip.
3. Hold down the Command key, then click the Out point of an outgoing audio clip. Holding down the Command key while selecting an edit point allows you to add edit points to the current selection without deselecting previously selected edit points. Note: In this example, Command-clicking the Out point of a stereo pair audio clip results in adding both audio items to the selection. You can also Command-Option-click a single audio item to add it to the selection individually, without including other audio items linked to it. This can be especially useful for clips in which many audio items are linked to a single video item in the Timeline.
4. Use the Ripple tool to trim the above selection.

Each opposite set of edit points moves in opposite directions, allowing you to create a split edit. A/V sync is maintained.

Removing Subclip Limits Affects All Affiliate Clips
As a result of the relationship between master and affiliate clips, changes made to certain properties of a master clip or subclip are automatically made to all affiliated clips within the current project. The same is true of subclips and any affiliates associated with them.

In particular, if you extend the In and Out points on a subclip to those of the original master clip, your subclip now has all of the media in the original master clip. Therefore, if you remove the limits from one subclip, Final Cut Pro removes the limits from all other subclips associated with it.

Duplicate Frame Detection Over Transitions
When Show Duplicate Frames is turned on in a sequence's settings, duplicate frames that occur over the duration of a transition between two clips are indicated by white dots to the left and/or right of that transition. The side of the transition the dots appear on indicates the clip or clips that use duplicate frames.

Figure 1 The white dots indicate duplicate frames used in a transition.

If you use a clip more than once within a single edited sequence, the duplicated frames are marked by a colored bar appearing at the bottom of the clip's video item in the Timeline.

Figure 2 The red bars indicate duplicate frames used within a sequence.

However, if the duplicated frames fall outside the boundaries of the clip in the Timeline or fall within a transition, a special indicator-four white dots-appears where the duplicate frames are located. When you zoom out, the white dots decrease in range from four to zero, depending on the zoom level.

Additional Options in the Track Layout Menu in the Timeline
The Track Layout menu now includes five additional options. These options can also be set in the Timeline Options tab of the Sequence Settings window.

- Show Video Filmstrips
- Show Audio Waveforms
- Show Through Edits
- Show Duplicate Frames
- Show Clip Labels

To choose an option in the Track Layout menu:
Open the Track Layout menu (the arrow next to the Track Height control), then choose an option. A checkmark next to a setting indicates that it is on. Choose the option again to remove the checkmark.

Command Key Gears Down Faders and Panning Sliders in the Audio Mixer Tab
Holding down the Command key while moving faders and panning sliders gears down their motion, allowing you to make more precise changes.

Indicator Colors for Mute Button, Mute Control, and Solo Button
The mute buttons for each channel in the Audio Mixer and the mute control in the Timeline editing controls are light amber when mute is enabled. The solo button is dark red when turned on. When you solo a track, the mute controls of all non-soloed tracks are automatically turned light amber; this way, you can tell which tracks are soloed and which are muted, if other tracks are not displayed in the Timeline window.

Ability to Export 16-Bit or 24-Bit Resolution OMF Files
You can now export OMF files at either 16-bit or 24-bit resolution, which is useful if your project includes 24-bit OMF files. Choose File > Export > Audio to OMF, and in the OMF Audio Export dialog, choose an option from the Sample Size pop-up menu-16-bit or 24-bit. If you choose to export as 24-bit files, keep in mind that these OMF files are large due to the wider data format and Final Cut Pro has a 2 GB limit for OMF files.

Display of Items in the Render Manager
Items in the Render Manager are now displayed in three groups: audio, audio mixdown (sequence level audio render files), and video.

Display of Real-Time Effects in Bold
The effects that appear in bold depend on the video format used by the currently selected sequence. Video formats that have higher system requirements for real-time playback result in fewer effects displaying in bold.

New DV Sequences Created With White Setting
DV sequence presets in Final Cut Pro 4 use a default white point setting of White instead of Super-White. (There are several DV sequence presets that use Super-White; these are labeled as such.)

Master Comment Information Can Be Included in EDLS
When you export an EDL, you can now choose to export Master Comments 1-4 or Comment A-B in the EDL Export dialog. These appear as notes in the EDL, letting offline editors give notes to the online editor about complicated entries on the list.

Late-Breaking Issues
Changes in the Final Cut Pro 4 Tutorials
In the "Distributing Media" section of the Final Cut Pro Tutorials , the instructions for exporting a QuickTime movie on page 114 are incorrect. For correct instructions on how to export a QuickTime movie, see the Final Cut Pro User's Manual or Final Cut Pro Help.

Interface Name Changes
The following names of interface items have changed.

Former name	New name	Found
External Video tab	A/V Devices tab	Audio/Video Settings window
External Video	Video Playback	Audio/Video Settings window, Summary tab
External Audio	Audio Playback	Audio/Video Settings window, Summary tab

Media Time	Source Time	Timecode Duration and Current Timecode fields in Canvas and Viewer
Image Sequence	Layered Graphic Sequence	Item Properties window, Format tab, Type entry
23.976 fps	23.98 fps	Sequence Settings window, Timeline Options tab, Editing Timebase pop-up menu
Insert Settings tab	Mastering Settings tab	Edit to Tape window
Record Settings option	Record to Tape option	RT pop-up menu in the Timeline
Duplicate Frames option	Dupe Frames option	Timeline shortcut menu for a clip with duplicate frames
Current w/o FX option	Current w/o Filters option	Frame Viewer pop-up menu in the Frame Viewer tab of the Tool Bench window

Menu Command Name and Location Changes
The following menu commands have changed names and in some cases, locations.

Formerly found and named	Now found and named
Mark>Go To>Match Frame	View>Match Frame>Source File View>Match Frame>Master Clip
File>Export> Movie	File>Export>QuickTime Movie
File>Export>QuickTime Movie	File>Export>Using QuickTime Conversion

Changes to the RT Pop-Up Menu in the Timeline
One menu option has been added and one renamed in the RT pop-up menu in the Timeline.

- Safe RT: This real-time effects playback mode ensures that no frames will be dropped during real-time effects playback. If you choose Unlimited RT instead, you increase the number of real-time effects that can be played back, at the expense of potentially dropping frames during playback.
- Record to Tape section: The Record Settings option in the RT pop-up menu has been renamed Record to Tape.

3:2 Pull-Down Pattern Setting Renamed to 2:3:2:3
Pull-down insertion is a method of converting 23.98 fps video to the NTSC standard of 29.97 fps video. The 3:2 pull-down pattern setting in the Playback Control tab of the System Settings window is now labeled 2:3:2:3 to be more specific about what is actually happening. Because it's the most commonly supported pull-down pattern for NTSC devices, it is the default.
Note: These options are only available when you are editing a sequence with a 23.98 fps timebase.

Pull-Down Pattern Settings With 24P
If you are editing a 23.98 frames per second (fps) DV sequence and you change the pulldown pattern in the Playback Control tab of the System Settings window and the pattern does not change, you must choose High from the Video Quality pop-up menu in the Playback Control tab. Even then, some slower systems may be limited to 2:2:2:4, which is indicated in the RT pop-up menu in the Timeline.
Note: The pull-down capabilities for a particular sequence are based on system performance. Check the RT pop-up menu in the Timeline for the capabilities of a particular sequence.

Changes in the Audio Mixer Interface

- The Master audio meters in the Master pane of the Audio Mixer have numeric values from +12 decibels (dB) to -96 dB.
- There are no clip indicators on audio meters in the Track Strips pane of the Audio Mixer.
- The Record Audio Keyframes setting is now a button in the button bar of the Audio Mixer window. Click it to toggle the setting on (green) and off (gray).

Default Location of Easy Setup Files
By default, the files for Easy Setups you create are stored in the following location: Library/Application Support/Final Cut Pro System Support/Custom Settings.

New Location for Third-Party Presets
To install third-party preset files or use preset files that you've moved, you must drag the desired preset files to the following folder:
`Library/Application Support/Final Cut Pro System Support/Plugins.`

The next time you open Final Cut Pro, the presets will be available in the Audio/Video Settings window.

New Location for Locked Presets
Presets are stored with the Easy Setup they are used with. If you want to lock a preset that you've created, you can make a custom Easy Setup and store it in the folder where locked Easy Setups are located. To lock a preset that you've created, as part of a custom Easy Setup, drag your custom Easy Setup from
`Library/Application Support/Final Cut Pro System Support/Custom Settings`
to
`Library/Application Support/Final Cut Pro System Support/Plugins.`

Note: You must quit Final Cut Pro and reopen the application for the preset to appear locked in one of the preset tabs in the Audio/Video Settings window.

About Audio Units Plug-ins
Audio Units plug-ins that do not support mono-to-mono processing will not load in Final Cut Pro. Audio Units plug-ins that do not support the "TailTime" property will load and will be adjustable in real time when low quality is selected for audio playback, but will always require rendering at medium or high quality. Custom Audio Units interfaces are not supported.

Opening Projects Created in Earlier Japanese Versions of Final Cut Pro
If you want to use a project that you created in an earlier Japanese version of Final Cut Pro, you must have Japanese specified as the primary language in the Language pane of the International pane in System Preferences. This ensures that the system encoding is Japanese.

Master/Affiliate Relationships Don't Automatically Work in Imported iMovie Projects
When you first open an iMovie project into Final Cut Pro, there is no master/affiliate clip relationship in the newly created project. Once you import an iMovie project, there are two ways to correctly create the master/affiliate relationships in the sequence: using the Media Manager, or using the Create Master Clips command.
To import and correctly establish master/affiliate relationships in an iMovie project:

1. Choose File>Open, navigate to where the iMovie project is located on your computer, then click Choose.
2. To use the Media Manager:
    1. Click the tab in the Browser corresponding to the imported iMovie project, then select the sequence in the project.
    2. Choose File>Media Manager.
    3. In the Media Manager, choose the following options, then click OK.
        - Media pop-up menu: Use existing
        - Delete unused media checkbox: Off
        - Duplicate selected sequence and place into a new project: On
    4. In the Save dialog, enter a name for the new project, choose a location, then click Save. A new bin is created which contains the master clips. All master/affiliate relationships will work properly in the new project you created. You can discard the originally imported iMovie project file.
3. To copy and paste and use the Create Master Clip command:
    1. Double-click the sequence to open it in the Timeline, then Choose Edit>Select All to select all clips in the sequence. Note: Don't select the sequence itself (in the Browser), or you'll end up with a nested sequence.
    2. Choose Edit>Copy to copy all the clips.
    3. Choose File>New>Sequence to create a new sequence.
    4. Double-click the sequence to open it in the Timeline, then choose Edit>Paste to paste all the clips into the new sequence.
    5. In the Browser, select the new sequence, then choose Tools>Create Master Clips.

A new bin is created which contains the master clips. All master/affiliate relationships will work properly in the new project you created. You can discard the

originally imported iMovie project file.

Sequences Not Flagged as Anamorphic When Importing iMovie Projects
If you import an iMovie project with anamorphic clips, those clips do not appear as anamorphic. For the clips to appear properly, you must change the anamorphic setting in the sequence. To change imported iMovie clips to anamorphic:

1. Open the imported sequence in the Timeline.
2. Choose Edit>Select All, then choose Edit>Cut.
3. Choose Sequence>Settings.
4. In the General tab, select the Anamorphic 16:9 checkbox, then click OK.
5. Choose Edit>Paste to paste the clips into the anamorphic sequence.

Opening Items Into the Viewer When the Playhead Sync Pop-Up Menu Is Set to Open
When you choose the Open setting in the Playhead Sync pop-up menu in the Viewer, the playhead in the Viewer is locked to the playhead in the Canvas whenever a sequence clip is opened into the Viewer, so that both playheads scrub together, displaying the same frame. As the playhead moves through your sequence, the clip that appears at the current position of the playhead is automatically opened into the Viewer.

The order in which items open into the Viewer has changed. Final Cut Pro looks first for a video item on an Auto Select track, from top to bottom tracks, then for an audio item on an Auto Select track (bottom to top), then for a video item on any video track (top to bottom), then finally, an audio item on any track (bottom to top).

If you place the playhead over a gap, no new slug is opened into the Viewer. The Viewer displays the last clip opened.

Opening Multichannel Clips Into the Viewer
If the In and Out points of a merged or linked clip's audio don't match, and you double-click the clip in the Timeline, only the individual item you clicked opens into the Viewer. If you are in the Browser and open the same merged clip into the Viewer, all linked video and audio items open simultaneously in individual tabs in the Viewer.

Field Dominance of Sequences With Progressive Scan Clips Must Be Set to None
Whenever you capture clips from progressive scan sources (such as cameras with a progressive scan mode), the field dominance of these clips should be set to None in the Format tab of the Item Properties window. You must also must make sure that all sequences you edit progressive scan clips into have their field dominance set to None. This prevents artifacts from occurring in motion effects that you apply to these clips.

Multiple Edits Window Layout Removed From Arrange Submenu
Final Cut Pro comes with a set of predefined screen layouts. These layouts determine the size and location of the four main windows in Final Cut Pro (the Browser, Viewer, Canvas, and Timeline), along with the Tool palette and audio meters.

To choose a screen layout, Choose Window > Arrange, then choose an option from the submenu. The Multiple Edits layout has been removed from the submenu and is no longer available.

Using Imported Clips and Sequence Settings
The following information is an update to the section, "Using Imported Clips and Sequence Settings" found in the Final Cut Pro User's Manual, Volume I, page 372. When you view the clip
in the Canvas, there's a black border around it because the Canvas is set to properly view clips at 720 x 480. (The manual incorrectly stated the resolution of 720 x 486.)

Sync Adjust Movies Over Preference Has Been Removed
The Sync Adjust Movies Over preference available in earlier versions of Final Cut Pro has been removed from the General tab of the User Preferences window. The A/V sync of all captured clips in Final Cut Pro 4 is automatically maintained no matter which video device you capture from.

RT Scrubbing Command Removed From the Sequence Menu
The RT Scrubbing command available in the Sequence menu of earlier versions of Final Cut Pro has been removed. Improved performance makes it no longer necessary.

Viewing Item Properties for Clips
The Item Properties window provides you with information for an individual clip. Three tabs in this window-Format, Timing, and Logging Information-allow you to view or change various properties of a clip.

In the Browser, you can only view the Item Properties of one clip at a time. If you select more than one clip, you'll only see information for the first clip. However, in the Timeline, you can select multiple clips and view all of their Item Properties in the same window.

To view Item Properties:

1. Do one of the following:
    - Select a clip in the Browser.
    - Select one or more clips in the Timeline.

2. Do one of the following:
    - Choose Edit>Item Properties, then choose an option from the submenu.
    - Control-click the clip, then choose Item Properties from the shortcut menu.

Keyboard Shortcuts for Play Every Frame Command
In the Viewer and Canvas, you can choose to play every frame of a clip. To do this using keyboard shortcuts, press Option-\\ or Option-P.

Tracks Are Not Added to the Timeline When Using the Edit Overlay in the Canvas or Keyboard Shortcuts
When you use the Edit Overlay in the Canvas or press a keyboard shortcut to perform an edit, no tracks are added to the Timeline. If a clip that you want to edit into the Timeline has more tracks than are currently present in the Timeline, you must create the necessary number of additional tracks before you can edit the clip in. If you don't, the additional tracks are not edited into the Timeline. You can also drag a clip to the audio tracks area to create an additional track.

Timecode Navigation and Shortcuts
There are several ways to enter and navigate using timecode. You can move the playhead to a specific frame by entering a complete timecode number in the Current Timecode field in the Canvas or Viewer, then press Return or Enter. You don't need to click in the field to enter a new timecode; simply enter the timecode.

To avoid typing zeroes when moving by larger amounts, type a period instead. And instead of moving the playhead to an absolute timecode number, you can move it relative to its current position by pressing the + and - keys. For example, to move the playhead 1 minute and 20 frames back from the current position, type

```
-01.20.
```

Note: The period automatically adds 00 to the minutes and seconds field.

Marking and Matching Controls
The marking and matching controls in the Canvas shown in the Final Cut Pro User's Manual, Volume II, page 105, are called out incorrectly. These controls are used to place sequence In and Out points, markers, and keyframes in the current sequence. You can also use the Match Frame control to do match frame editing in the Canvas and Viewer. The correct location of each control is shown below.

Figure 3 Mark In (A), Mark Out (B), Add Marker (C), Add Keyframe (D), Match Frame (E), Mark Clip (F)

Editing Information for a Marker
The following is an update replacing the information found in the Final Cut Pro User's Manual, Volume II, pages 274 and 275 regarding renaming and moving markers.

If you want to edit information for a marker, either the name or the position by entering new timecode, press Command-Option-M to open the Edit Marker dialog for the nearest preceding marker to the playhead (not the nearest marker).

Scrolling Vertically Through a Zoomed-In Timeline
If you're using a PowerBook computer, Shift-Page Up and Shift-Page Down do not scroll horizontally through the Timeline; instead, they scroll vertically.

Using Keyboard Shortcuts to Zoom In and Out of the Timeline
Pressing Option-+ (plus) or Option-- (minus) zooms in or out of the contents of the Timeline, as long as the Browser is not the active window.

Mute Overrides Solo in the Timeline and Audio Mixer Tab
If a track's solo control is already turned on, turning on mute overrides the solo status of that track and the track is silenced.

Determining the Duration of a Gap in the Timeline
The following is an update replacing the information found in the Final Cut Pro User's Manual, Volume II, page 262.

To determine the duration of a gap in the Timeline:

1. Make the track with the gap the destination track.
2. Lock all audio tracks or make sure Auto Select is turned off for all other tracks.
3. Position the playhead in the gap.
4. Do one of the following:
    - Choose Mark>Mark Clip.
    - Click the Mark Clip button in the Canvas.
    - Press X. The gap's duration appears in the Timecode Duration field in the Canvas.

Changing the Label of a Clip Changes Labels of All Affiliated Clips
If you use labels to identify and sort your clips in the Browser, the clips' names are highlighted in the color that matches each label. Using keyboard shortcuts, you can change the labels of clips directly in the Timeline. Changes made to the label of any clip are also applied to all of that clip's affiliated clips.

Playhead Sync Pop-Up Menu Uses Icons
The Playhead Sync pop-up menu in both the Viewer and Canvas has options listed in text, but displays the selected option with an icon, with a different icon for each option.

Keyboard Shortcut for Deselect All Has Changed
The default keyboard shortcut for Deselect All is now Shift-Command-A (not Command-D).

Assigning or Changing Destination Tracks Using the Shortcut Menu
There are several ways to assign a destination track in the Timeline or change destination track assignments. One of these is to choose an option from the shortcut menu, using the Control key. (This replaces information in the Final Cut Pro 4 User's Manual, which states that Command-clicking will display the shortcut menu.)

To assign a destination track in the Timeline:

- Control-click a Source control, then choose a new destination track from the shortcut menu.
- Control-click a destination control, then choose a Source control to assign to it from the shortcut menu.

To change destination track assignments:

- Control-click a Source control in the Timeline, then choose a track from the shortcut menu.
- Control-click a Destination control, then choose a Source control from the shortcut menu.

Timecode Overlays Information
Video and audio timecode overlays are shown at the bottom (not the center) of the Canvas and Viewer. This includes the time code for every clip in the Timeline that intersects the current position of the playhead. The column on the left shows video and the column on the right displays audio.

Drop Frame Timecode Not Available for 23.98 fps Sequences
Selecting the Drop Frame checkbox in the Timeline Options tab of the Sequence Settings window makes your timecode drop frame. This option is not available for PAL sequences or 23.98 fps sequences.

DV Timecode Is Not Always Drop Frame
DV timecode is not always drop frame only. DV timecode is always non-drop frame for 25 frames per second (fps) (PAL) and 23.93 fps (24P) recording. All DVCPRO, most DVCAM, and some DV cameras allow you to choose drop or non-drop frame timecode in their menus. For more information, see the documentation that came with your equipment.

Linking Clips in the Timeline Prior to Creating a Merged Clip
When creating a single merged clip by dragging multiple items from the Timeline into the Browser, all clips to be merged need to be selected and linked in the Timeline before they are dragged into the Browser. If you don't link them in the Timeline first, each unlinked clip will appear as a separate item when the group is dragged into the Browser.

Note: Only one video and up to 24 audio items can be linked together in the Timeline in preparation for making a merged clip.

Finding Master Clips
You may find it necessary to find the master clip in the Browser that is affiliated with a particular clip in the Timeline. You can do so using the Master Clip command.

To find an affiliate clip's master clip:

1. Select a clip in the Timeline.
2. Choose View>Match Frame>Master Clip. The master clip is automatically highlighted in the Browser.

Locating a Match Frame
Finding a match frame can be useful if you want to quickly reedit a clip that's already been edited into your sequence, or if you need to quickly access a sequence clip's master clip to edit another part of it into your program.

To open a sequence clip's master clip into the Viewer using the Match Frame option:

1. Position the playhead in the Canvas or Timeline on the clip you want to copy into the Viewer, at the specific frame that you want to locate.
2. Make sure the track that contains the clip you want to match is the destination track.

Audio Sync Tool for the Panasonic DVX-100
To address the way the Panasonic DVX-100 handles audio/video sync, the DVX-100 Audio Sync Tool plug-in is available in the DV Camera Tuner Scripts folder on the Final Cut Pro 4 installation DVD. If you're working with clips captured from the Panasonic DVX-100, you should move this plug-in to the following location:
Library/Application Support/Final Cut Pro System Support/Plugins

When the DVX-100 Audio Sync Tool plug-in is installed, a new menu item appears in the Tools menu, Offset Audio Sync.

To use the Offset Audio Sync tool:

1. In the Browser, select any clips you captured that were recorded with the DVX-100.
2. Choose Tools>Offset Audio Sync. The audio of all selected clips will be offset 2 frames later than the video to adjust their sync.

Note: Adjustments made to clips using the Offset Audio Sync command are only saved in the Final Cut Pro project file where the adjustment was made. The corresponding source media on disk is unaffected.

Using the Solo Item Command to Disable Multiple Audio Clips
The following is an update replacing the information found in the Final Cut Pro User's Manual, Volume II, page 264. The Solo Item command disables all unselected audio clips in the Timeline that appear in other tracks at the position of the playhead. (An audio clip can be enabled and disabled using the Enable command in the Modify menu.)

To disable multiple clips simultaneously:

1. In the Timeline, position the playhead on the audio clip you want to solo.
2. Select the audio clip that you want to keep enabled.
3. Do one of the following:
    - Choose Sequence>Solo Selected Item(s).
    - Press Control-S. All audio clips on tracks other than the audio clip you selected are disabled.

4. Choose Sequence>Solo Selected Item(s) again to re-enable the disabled audio clips.

Outputting Timecode During a Print to Video Operation to the DVX-100
Drop frame timecode is always written to an unstriped blank tape whenever you output video from Final Cut Pro using the Print to Tape command with the Panasonic DVX-100 camera, regardless of what timecode is set in your sequence.

To output a sequence with non-drop frame timecode:

1. Turn off 1394 TC Regen in the DVX-100 menu settings. See the documentation that came with the Panasonic DVX-100 for more information.
2. Stripe the tape you want to output to using the Black and Code control in the Edit to Tape window.

Edit to Tape Audio Insert Pop-Up Menu Has New States
Audio channels that are available to be recorded to can be enabled and disabled individually, or all at once. To record-enable an audio track, choose it from the Audio Insert pop-up menu and a checkmark appears next to it. Choose it a second time to remove the checkmark and disable the track.

Eight audio channel indicators in the Audio Insert pop-up menu indicate which audio tracks are being output. The color of an audio channel indicator indicates its state. The colors have changed. The following is an update replacing the audio channel indicators listed in the Final Cut Pro User's Manual.

- Yellow: Indicates the audio track is available.
- Gray: Indicates the audio track is unavailable.

Changes to Automatic Rendering
The following information replaces that found in the Final Cut Pro 4 User's Manual, Volume I, page 160.

The Auto Render preference allows you to take advantage of idle computer time when you're not editing to render open sequences in the Timeline. Three options determine what parts of your opened sequences are rendered and when: Start Render After, Which Sequences, and Render Real-Time Sequences. When the number of minutes specified in the Start Render After field has elapsed with no user activity, a progress dialog appears indicating the following sequence of events:

1. If Autosave is selected, the project is automatically saved prior to rendering.
2. All selected regions of the currently open sequence are rendered in this order: red, yellow, dark yellow, and orange video, then red audio (for playback).
3. Second, all red video sections are rendered.
4. All red audio (for playback) sections are rendered.
5. All yellow and dark yellow sections are rendered.
6. All orange video sections are rendered.
7. If the Render Real Time Segments option has been selected, all item render audio and green sections of the Timeline are rendered.
8. If the Which Sequences pop-up menu is set to Open Sequences, then steps 2 through 7 are followed for each open sequence. The project is automatically autosaved after each render.

Edit to Tape Window Has New Icons
In the Video tab of the Edit to Tape window, two icons have changed. The Insert Timecode icon is now a yellow round clock icon, similar to the Timecode Duration and Current Timecode icons found in the Viewer and Canvas. The Insert Video icon is now a yellow frame of film with no letters.

Support for Audio Interfaces With Multiple Input Channels
During capture, Final Cut Pro only supports the first two channels of audio interfaces with multiple input channels. Any additional channels do not appear in the Audio/Video Settings window, and appear to have fewer output channels than they really support.

Despite this, the actual number of audio output channels supported by your audio interface is available for playback, Edit to Tape, and Print to Video operations. Audio outputs in sequences may be assigned to a maximum of 24 audio channels. In this situation, you may get a warning dialog improperly stating that the output

map you've selected for this sequence contains more channels
than the output device. If you know your audio interface supports the appropriate number of audio channels, you can ignore this alert.

Rendering Nested Audio
When you add a nested audio sequence to a sequence in the Timeline and then render it, audio levels of individual channels are not reflected during playback in the Audio Mixer. A rendered nested audio sequence is mixed down to a stereo pair. Final Cut Pro 4 saves processing at the track level by reading the output only. This is also why you can't perform mixer automation within a rendered nested audio sequence.

Final Cut Pro 4: About What's New

- **Last Modified:** June 14, 2007
- **Article:** TA27417

- **Old Article:** 93158

This is an overview of the new features in Final Cut Pro 4.

Products Affected

Final Cut Pro

What's New in Final Cut Pro 4

This is an overview of the new features in Final Cut Pro 4. For more information on these features and their use, see the Final Cut Pro 4 User's Manual or Final Cut Pro Help.

Improvements for Setup

Missing scratch disk warning

You are now warned when scratch disks become unavailable. This can happen for a number of reasons: They might be turned off, disconnected, or temporarily unmounted. If the scratch disk folder you selected has been moved, deleted, or renamed, Final Cut Pro might not be able to find the scratch disk. The next time you open Final Cut Pro, if the scratch disk can't be found, a dialog appears with three options:

- Quit
- Set Scratch Disks : Choose a new scratch disk
- Check Again : Allows you to reconnect or start up your scratch disk, wait for it to mount, and then proceed as usual.

New screen layouts

There are several new screen layouts, including:

- Audio Mixing: This places the Viewer, Canvas, and Tool Bench at the top of the screen. The Tool Bench window contains the Audio Mixer tab. The Browser and Timeline are on the bottom, with the Tool palette and audio meters to the right of the Timeline.
- Multiple Edits: This layout only appears if your screen resolution is set to 1280 x 854 or higher. This layout is useful for comparing three clips in a sequence in a row for color correction. At the top of the screen, from left to right, are the Viewer; a Tool Bench window with a Frame Viewer tab showing the previous edit point; the Canvas; and another Tool Bench window with a Frame Viewer tab showing the next edit point. The Browser and Timeline are on the bottom, with the Tool palette and audio meters to the right of the Timeline.

Other improvements to screen layouts include the following:
You can now create and save multiple-monitor screen layouts.
Screen layouts are now resolution specific; a new screen layout's minimum required resolution is the resolution your monitor was set to when that layout was created.

Interface Enhancements

Customizable keyboard shortcuts

All commands in Final Cut Pro can be assigned to customizable keyboard shortcuts using the Keyboard Layout window by choosing Tools>Keyboard Layout>Customize. The default keyboard shortcut layout can be changed at any time to better suit your needs. For example, if your style of editing requires a

particular set of commands that isn't readily available by default, you can modify the default keyboard layout with your own set of commands.

You can also create different keyboard layouts for different tasks, switching between them at will. For example, you may find it useful to create different keyboard layouts for editing, color correction, and audio mixing.

Customizable button bars in each window

Shortcut buttons can be created and placed along the top of the main windows in Final Cut Pro-the Browser, Viewer, Canvas, Timeline, and any Tool Bench windows. You can then click any of the shortcut buttons in this button bar to perform commands, instead of entering key combinations or using menus.

Resize multiple Final Cut Pro windows simultaneously

You can now place the pointer at the intersection of two or more windows in Final Cut Pro and resize all of them simultaneously when the Resize Window pointer appears. To resize multiple windows in Final Cut Pro, move the pointer over the border between the windows you want to resize. When the pointer changes to the Resize Window pointer, drag the border in the desired direction to resize the appropriate windows. The windows on either side of the border are resized accordingly.

Resize individual tracks in the Timeline
You can change the size of individual tracks in the Timeline by dragging a track's boundary in the Timeline patch panel:

- If it's a video track, drag the upper boundary of the track in the Timeline patch panel.
- If it's an audio track, drag the lower boundary of the track in the Timeline patch panel.

Save custom Timeline track layouts
Once you've created a custom track layout for your sequence, you can save it for future use. Saved custom track layouts appear in the Track Layout menu, and can be applied to any sequence that's open in the Timeline. Up to 40 custom track layouts can appear in the menu at once.

Assign destination tracks for editing using the new Timeline patch panel
Many editing operations in Final Cut Pro require you to use the Source controls in the Timeline to assign destination tracks to determine where edited, duplicated, or moved clips will appear. Source and Destination controls are located in the Timeline patch panel, at the left of the Timeline window.

When you open a clip or sequence into the Viewer, a number of Source controls appear in the Timeline patch panel and correspond to the number of video and audio items that make up that clip, or the number of tracks that appear in that sequence. For example, if you open a clip into the Viewer that contains one video and four audio items, one video and four audio Source controls appear in the Timeline patch panel.

A merged clip may consist of 1 video and up to 24 audio items, so typically as many as 25 Source controls will appear in the Timeline. You can also open a sequence into the Viewer, in which case as many as 99 video and 99 audio tracks can appear in the Timeline, depending on how many tracks there are in the sequence. Whenever you open a new clip or sequence into the Viewer, the number of Source controls in the Timeline patch panel updates to reflect the number of video and audio items in the new clip or sequence.

Auto Select controls in the Timeline
Enabling the Auto Select controls of specific tracks in the Timeline allows the contents of those tracks to be selected via In and Out points in the Timeline or Canvas, just as if you'd used the Range Selection tool. When In and Out points are defined in the Timeline, operations such as the Copy command and lift edits are limited to the selected regions of tracks that have Auto Select turned on.

When one or more Auto Select controls are enabled, regions of clips in the Timeline defined by In and Out points are highlighted, which indicates that these regions can be operated upon.

Mute and solo controls in the Timeline
Click a track's mute button to turn off audio playback for that track. The mute button affects monitoring during playback only. When a track is muted, it isn't audible during playback, but is still output during Print to Video and Edit to Tape operations, or when exported to an audio or movie file.

Click a track's solo button to mute all tracks that don't also have solo enabled. For example, if you click the solo button on track A1, and it's the only track with solo selected, all other audio tracks are muted. If you enable the solo button on multiple tracks, all tracks with solo enabled play back, while all other tracks are muted. Like the mute button, the solo button affects monitoring during playback only. If solo is enabled on at least one track in a sequence, tracks that don't have solo enabled are not audible during playback, but are still output during Print to Video and Edit to Tape operations, or when exported to an audio or movie file.

New Timeline zoom functionality
Timeline zoom functionality has been improved. You can zoom into the Timeline in any of the following ways:

- Drag the thumb tabs on either side of the Zoom slider to adjust both ends of your view at the same time. If the playhead is visible, it stays centered during the zoom. If the playhead is not visible, the visible area of the Timeline stays centered.
- Hold down the Shift key while you drag one of the thumb tabs to zoom in or out of your sequence from the selected end of the Zoom slider, while keeping the other thumb tab locked in place. This also moves the visible area of the Timeline in the direction you're dragging as you zoom.
- Click or drag the Zoom control to view the Timeline at a different time scale while keeping either the playhead or the current area of the Timeline centered. Clicking to the right of the control zooms out to show more of your sequence; clicking to the left zooms in to show more detail.

Custom column layout menu in the Browser
You can create customized column layouts for your own specific uses, and save these arrangements as custom layouts for easy access at any time. The custom column layouts you save appear in the shortcut menu that appears when you Control-click any column heading in the Browser except the Name column.

New Preferences

New organization of preferences
All preferences have been reorganized into two windows-User Preferences and System Settings.

Memory usage settings
Two sliders in the Memory & Cache tab of the System Settings window allow you to decide how much of the available RAM in your computer to use when working in Final Cut Pro. Your computer's available RAM is defined as the amount of RAM not used by Mac OS X and other currently open applications. By limiting the amount of RAM Final Cut Pro uses, you can maintain Final Cut Pro's performance by preventing Mac OS X from using virtual memory unnecessarily. This is especially important when multiple applications are open at the same time.

Additional Timeline display options
There are several new display options for the Timeline in the Timeline Options tab of the User Preferences window, including:

- **Show Duplicate Frames**: Select this option to mark clips that are used more than once within a single edited sequence. Colored bars appear at the bottom of the clip's video item in the Timeline if that clip has been used more than once. You can adjust the parameters that determine when duplicate frames indicators appear in the General Preferences tab.
- **Show Audio Controls**: Select this option to display the mute and solo buttons to the left of each audio track in the Timeline. By default, these controls are hidden. Audio controls can also be displayed using the Audio Controls button in the Timeline.
- **Video and audio keyframe editor**: The keyframe editor shows you keyframe graphs for motion effects or parameters of filters applied to clips in your sequence. These graphs are identical to those found in the keyframe graph area of the Motion and Filters tabs in the Viewer. You can edit keyframes in the keyframe editor using the Selection and Pen tools. The keyframe editor can only display the keyframe graph of one effect parameter at a time.
- **Video and audio speed indicators**: Speed indicators show you the speed of clips in your sequence using tic marks. The spacing and color of these tic marks indicate the speed and playback direction of your clips. The speed indicators of clips in the Timeline update in real time as you make variable speed adjustments to clips in your sequence, showing you exactly how you're altering a clip's timing. There are no user-adjustable controls in the speed indicator area.

Audio Outputs tab
The Audio Outputs tab contains a list of presets that allow you to define the number of audio output channels that are available to your sequence via external audio interfaces connected to your computer. The selected audio output preset is automatically assigned to all new sequences and projects you create. Each sequence in your project has its own individual audio output settings. After a sequence has been created, any future changes to its audio output settings must be made in the Audio Outputs tab of the Sequence Settings window.

Real-Time and Rendering

Unlimited RT
Selecting the Unlimited RT option in the RT pop-up menu in the Timeline allows Final Cut Pro to play additional real-time effects that exceed your computer's real-time playback capabilities. Unrestricted real-time playback allows you play more effects, but increases the likelihood that your sequence will drop frames during playback. This mode is useful for getting a real-time preview of complex effects compositions.

RT pop-up menu in the Timeline
The Real-Time Effects (RT) pop-up menu allows you to adjust the playback quality of real-time effects in Final Cut Pro. Using the options in this menu, you can decide which is more important to you-visual playback quality, or maximizing the available effects that can be played back in real time.

For example, if it's more important to you to be able to view your program at the highest quality, you should deselect the Unlimited RT option and select the High playback option in this menu. This ensures that your program's video quality is always as high as possible, and that no frames are dropped during playback. The tradeoff in this case is that the number of simultaneous real-time effects that can be played back is reduced.

If you'd rather lower the playback quality of your video in order to increase the number of real-time effects that can be played back, you can select the Unlimited RT and Low playback quality options to maximize your computer's playback performance.

When you want to output your program to video, you can choose whether to render the effects that won't output at full quality in real time, or output them at the reduced quality you've selected in order to avoid rendering.

Note: Final Cut Pro always warns you before outputting video to tape at reduced quality when you use the Print to Video and Edit to Tape commands.

Software-based real-time effects can be output using FireWire and other built-in video interfaces
All real-time effects can be output to an external video monitor using FireWire or the built-in video output of a Macintosh PowerBook G4. This is true whether you're using OfflineRT or DV source media in your projects. Outputting real-time effects to video using FireWire is a processor-intensive operation, requiring a very fast computer. Outputting this way will significantly reduce the maximum number of effects that your computer can play in real time.

Real-time pull-down insertion for 24 fps sequences
If you're editing 24 fps video, Final Cut Pro can play back and export your DV or OfflineRT sequence with 3:2 pull-down added. This lets you output 24 fps video to 29.97 fps using FireWire or the built-in video output of a Macintosh PowerBook G4 for viewing or exporting to tape, all in real time.

Improved management of audio and video render cache files
Audio and video render cache files are handled differently, eliminating the need to rerender effects in many instances:

- Audio and video render cache files are now managed separately. Modifying video edits and making changes to video effects that overlap audio effects no longer affects rendered audio render cache files, and vice versa.
- Audio and video render cache files are preserved when clips are duplicated or copied and pasted.
- New item-level rendering of audio clips allows you to preserve audio cache files for audio effects and rendered resampling while making changes to volume and panning levels.

Real-time effects playback and rendering options
Three new tabs allow you to control real-time effects playback and rendering in your projects:

- The Render Control tab in the User Preferences window allows you to enable and disable the most processor-intensive effects in Final Cut Pro. Changing the settings in the Render Control tab of the User Preferences window changes the default Render Control options that all new sequences are created with. To change the Render Control settings for existing sequences, alter these settings in your sequence's Sequence Settings window.
- All settings in the Playback Control tab in the System Settings window remain the same for all sequences and projects opened on that computer. These settings also appear in the RT pop-up menu in the Timeline. Using these settings, you can decide which is more important to you-visual playback quality, or maximizing the available effects that can be played back in real time.
- The Effect Handling tab in the System Settings window allows you to set how real-time effects are processed for clips compressed using a real-time-capable codec. This includes clips captured and compressed using the DV, DVCPRO-50, and Photo JPEG codecs. Such clips, by default, can play back software-based real-time effects applied directly in Final Cut Pro. If a third-party capture card capable of real-time effects processing is installed that can process these codecs, you can reassign real-time effects handling to your hardware, instead.

Auto-rendering
The Auto Render preference allows you to take advantage of idle computer time when you're not editing-such as during a coffee break or lunch-to render open sequences in the Timeline. Options in the General tab of the User Preferences window allow you to define how long to wait before rendering, which sequences to render, and whether or not to render real-time effects in the selected sequences.

Support for 10-bit video processing
Final Cut Pro now supports 10-bit video processing for selected filters and transitions.

Capture/Output

Automatic timecode break handling during capture
New timecode break handling allows Final Cut Pro to automatically capture over timecode breaks without interruption. You can now capture the footage from an entire tape, skipping every timecode break on the tape. The "On timecode break" pop-up menu in the General tab of the User Preferences window gives you three ways to avoid capturing media with timecode breaks:

- **Make New Clip**: This is the default option. Video that has already been captured before the break in timecode is saved as a single clip, with its Out point set to the frame occurring immediately before the dropped timecode instance. Final Cut Pro then automatically continues capturing video after the dropped timecode frame as a second media file. When this option is selected, clips captured after timecode breaks are named with the original name plus a dash and the number of the clip. For example, if the first captured clip's name is "Cats Playing," then the second clip's name is set to "Cats Playing-2." This is a good setting if you are batch capturing an entire tape at once. For example, suppose you are capturing the entire contents of a 60-minute tape that had four timecode breaks. Instead of making you restart capture every time a timecode break is detected, Final Cut Pro captures all media from the tape as five clips, skipping every timecode break and ensuring that the timecode of all captured media is frame-accurate and in sync.
- **Abort Capture**: If this option is selected, capture is stopped whenever a timecode break is detected. All media captured before the timecode break has frame-accurate timecode and is preserved. The resulting open media clip is saved to the Browser.
- **Warn After Capture**: If this option is selected, timecode breaks are reported after capture and the media file with the timecode break is preserved. It is unwise to use such a clip unless you have no choice, because timecode breaks result in incorrect timecode from the timecode break forward, and will impair your ability to accurately recapture your media.

Capturing audio and video to separate files now creates true merged clips
When you capture video and audio to separate files, two sets of media source files are saved on your hard disk, but the clips appear in your project as merged clips. Capturing your video and audio as separate files allows you to divide the workload between two scratch disks, maximizing the performance of each scratch disk you're using so that you can capture your video at the highest possible data rate. Video and audio media files that have been captured separately are no longer dependent on one another.

Advanced pull-down removal
Select the "Remove Advanced Pulldown (2:3:3:2) From MiniDV Sources" setting of your capture preset if you're capturing from a DV format source that used the 2:3:3:2 pull-down method to capture 24P video. You want to remove the 2:3:3:2 pull-down to eliminate the redundant frame fields created by the pull-down so that you can edit true 24 (actually 23.98) fps progressive video.

Pull-down insertion
If you're editing a sequence with a 23.98 fps timebase and you want to output to an NTSC device via FireWire, you can choose one of three pull-down insertion patterns from the RT pop-up menu in the Timeline. Pull-down insertion is a method of converting 23.98 fps video to the NTSC standard of 29.97 fps video. Depending on the speed of your computer, you can select from 3:2, 2:3:3:2, or 2:2:2:4 pull-down.

Control the quality of effects being output to video
When outputting a sequence with draft-quality proxy effects to video, you can choose whether to render the effects that won't output at full quality in real time, or output them at the reduced quality you've selected in order to avoid rendering by choosing Use Playback Settings from the RT pop-up menu in the Timeline.

Capturing audio using house sync
When capturing audio intended to be synchronized to video from a separate source, it's important that your device-controllable audio deck be synchronized to your computer via a common video timing signal, such as a blackburst generator (also referred to as house sync). This is true even if you're capturing your audio via a dedicated audio capture interface. This can be accomplished by connecting a blackburst generator to both the genlock connector (also called external sync) of your audio deck and to the genlock connector of an external video capture interface connected to your computer. When capturing audio from a genlocked audio deck, you need to select "Sync audio capture to video source if present" in the General tab of the User Preferences window.

Support for separate video and audio capture interfaces

You now have the ability to specify separate video and audio capture interfaces in the A/V Devices tab of the A/V Settings window.

Support for multichannel audio output
Final Cut Pro supports audio output via up to 24 outputs using Mac OS X-compatible audio interfaces. The Audio Outputs tab of the Sequence Settings window allows you to define the number of audio output channels that are available to tracks in your sequence via the external audio interface connected to your computer. All audio tracks in a sequence can be assigned to specific pairs of audio outputs using the shortcut menu in each audio track header in the Timeline.

Support for multichannel audio during Edit to Tape operations
Using a Mac OS X-compatible audio interface, you can now output up to eight audio channels while using the Edit to Tape command. The number of audio tracks that can be recorded to when using the Edit to Tape command depends on the number of audio tracks your video or audio recording device supports. When using a video or audio interface capable of outputting more than two channels of audio, you need to manually choose an appropriate audio track configuration based on the video or audio recording device you're recording onto. You can specify this configuration by selecting or creating a device control preset, and setting the Audio Mapping pop-up menu in the Device Control Preset Editor to the appropriate configuration for your recording device. The Audio Mapping pop-up menu does not automatically detect the number of audio tracks your video or audio recording device is capable of recording to. You need to choose a configuration based on your recording device's capabilities.

Clip Handling

Support for merged clips using separate video and audio source media
A merged clip is one that links to more than one source media file on disk. For example, a merged clip might link to both a QuickTime video file and a separate audio file. Merged clips allow you to synchronize the audio and video items of footage shot via dual system recording. Instead of syncing your video and audio onto tape prior to capturing, you can capture your audio and video separately, and then merge them together in Final Cut Pro.

You can sync a video clip with up to 12 stereo or 24 mono audio clips (merged clips can contain a total of 1 video and 24 audio items) using their timecode, In points, or Out points. After a group of clips has been synchronized in preparation to create a merged clip, select them all and choose Modify>Merge Clips.

New master/affiliate clip relationships within a project
Final Cut Pro 4 introduces master/affiliate clip relationships for clips used in a project. The first instance of a clip that is captured or imported into a project is a master clip. Editing a master clip into a sequence or duplicating it in the Browser results in the creation of a sequence clip or duplicate clip that is an affiliate of the original master clip. A relationship exists between the original master clip in the Browser and all edited or duplicated affiliates of that clip that appear in every sequence and in every bin of that project. For any group of affiliated clips in a project, there is only one master clip.

As a result of the relationship between master and affiliate clips, changes made to certain properties of a master clip, such as Clip Name, Reel Name, or Timecode, are automatically made to all affiliated clips within the current project. These same changes, if made to an affiliate clip, are also made to that clip's master clip, as well as to all other affiliated clips in the current project.

The online or offline state of clips is also automatically updated among all affiliated clips in a project, all at once. Suppose you open a project in which all the clips are offline. Relinking that project's master clips in the Browser automatically relinks all the affiliate clips that appear in each of that project's sequences, as well.

New commands, including Reveal Master Clip, Duplicate as New Master Clip, and Make Independent Clip, allow you to manage these clip affiliations. The Match Frame command opens a clip's affiliated master clip from the Browser.

Improvements to the Media Manager
Two new options give you more control over operations performed by the Media Manager.

- Include affiliate clips outside selection: You can choose whether or not to include additional marked master clip media and other affiliated clips in the selected Media Manager operation. How much extra media will be included depends on whether or not the "Duplicate selected items and place into a new project" option is selected.
  Including affiliate clips may dramatically increase the amount of media included by the Media Manager operation, but it will ensure that you include the maximum amount of useful footage by including master clip media that
  - is marked by an In point, Out point, or both
  - falls between two unconnected clips derived from the same master clip
  - appears as an affiliate clip in another sequence
- Base media file names on: This pop-up menu lets you determine how clips are named when they're segmented as a result of the "Delete unused media" option. Since the clip names used in your project do not necessarily match the name of the source media files on disk (you may have renamed them manually, for example), you can specify which names to use. You have two options:
  - Existing file names: Filenames of clips created by the Media Manager are based on the source media files on disk.
  - Clip names: Filenames of clips created by the Media Manager are based on the names you've given the clips inside your project.

Improvements to the Item Properties window
The Item Properties window has been updated. Three tabs in this window-Format, Timing, and Logging Information-allow you to view or change various properties of a clip. The Item Properties window can now show information for a group of linked clips in a sequence, merged clips, and groups of sequence clips that have been opened simultaneously.

Improved item linking in the Timeline
You can now link up to 1 video item and 24 audio items in the Timeline.

Additional support for modification of timecode in source media files
You can modify the Reel, Timecode, Aux 1, and Aux 2 timecode tracks directly in a clip's source media file on disk.

Editing

Dynamic trimming in the Trim Edit window
A new Dynamic Trimming option in the General tab of the User Preferences window allows editing in the Trim Edit window using the J, K, and L keys.

Dupe detection
You can now turn on the Show Duplicate Frames option in the Timeline Options tab of the Sequence Settings window. This option marks clips that are used more than once within a single edited sequence with colored bars appearing at the bottom of the clip's video item in the Timeline. Two options in the General tab of the Preferences window, Dupe Detection Handle Size and Dupe Detection Threshold, affect when and how duplicate frames indicators appear in the Timeline.

- Dupe Detection Handle Size: Adds frames to the beginning and end of the clip regions which are used for comparison, to determine whether or not to display duplicate frames indicators. This can be used to take into account the extra frames that must be used for physically cutting and cementing pieces of negative that are necessary for film matchback, to prevent you from accidentally including frames that can't really be used. By default, this is set to 0.
- Dupe Detection Threshold: Allows you to set a minimum number of frames that must be duplicated before a duplicate frame's indicator will appear. By default, this is set to 0 so that all instances of duplicated frames are indicated. You can set it as high as 99 frames (3 to 4 seconds, depending on the frame rate), in which case there would have to be a minimum of 99 consecutive duplicated frames before a duplicate frames indicator would appear.

Auto Select controls in the Timeline
Enabling the Auto Select controls of specific tracks in the Timeline allows the contents of those tracks to be selected via In and Out points in the Timeline or Canvas, just as if you'd used the Range Selection tool. When In and Out points are defined in the Timeline, operations such as the Copy command and lift edits are limited to the selected regions of tracks that have Auto Select turned on. When one or more Auto Select controls are enabled, regions of clips in the Timeline defined by In and Out points are highlighted, which indicates that these regions can be operated upon.

Editing clips from one sequence to another
Instead of nesting one sequence inside of another, you can edit the content of sequence A into sequence B-placing all of sequence A's clips directly into the Timeline of sequence B exactly as they appear in sequence A-using the Command key. Hold down the Command key while dragging sequence A into the Canvas to edit the clips contained by sequence A into sequence B.

Asymmetrical trimming
Asymmetrical trimming allows you to ripple edit opposing video and audio edit points in the Timeline to create split edits. Using the Ripple tool, you can Option-click to select an outgoing video edit point, then Command-click an opposite incoming audio edit point. When you use the Ripple tool to trim these selected points, they move in opposite directions, allowing you to create a split edit. For more information, see Late-Breaking News available via the Help menu.

Viewing media time or clip time in the Viewer
You can view the timecode of a clip in the Viewer using Source Time or Clip Time. Choosing Source Time guarantees that the current timecode displayed represents the timecode associated with that frame in your source media file. For example, if you change the speed of a clip to 50 percent, you effectively double the number of frames in that clip. With Source Time selected, each duplicated frame shows the correct timecode number of the frame in the media file it came from. Displaying Source Time is also useful for showing timecode with a timebase that doesn't match that of your sequence. For example, if a 29.97 fps clip is set to display the timecode from a 24 fps Aux 1 timecode track, choosing Source Time will accurately present these values in the Viewer. Source Time is always displayed in the Viewer and Browser in italics. If you choose Clip Time, the timecode displayed in the Viewer is incremented from the first timecode value in the clip forward, regardless of whether the timecode is correctly representing the current frame.

To choose Source Time or Clip Time, Control-click in the current timecode window of the Viewer, then choose a display method from the shortcut menu.

Ganging the Viewer and Canvas using the Playhead Sync pop-up menu
You can lock the playhead in the Viewer to the playhead in the Canvas so that they move together while scrubbing through clips. This is known as ganging. Ganging allows you to trim a clip in the Viewer by a duration specified by some event in the Timeline, such as the duration of an actor's action, the length of a clip, or the distance between two markers.

Ganging is especially useful when you're modifying clips with color correction filters applied. When adjusting color correction filters, you want to see the Color Correction tab in the Viewer that corresponds to the clip in the Canvas so that you're adjusting the right clip. Ganging lets you do this.

You use Playhead Sync pop-up menu to choose from four different ganging options:

- **Off**: Disables Viewer/Canvas ganging. The Viewer and Canvas playheads move independently of one another. This is the default behavior.
- Follow: The playhead in the Viewer is locked to the playhead in the Canvas whenever a sequence clip is opened into the Viewer, so that both playheads scrub together, displaying the same frame. For example, moving the Timeline playhead to the 20th frame of a clip in your sequence also moves the Viewer playhead to the 20th frame of that sequence's clip if it is also opened in the Viewer.
- **Open**: This option is identical to Follow, except that as the playhead moves through your sequence, the clip that appears at the current position of the playhead is automatically opened into the Viewer. For example, moving the Timeline playhead from clip A in your sequence to clip B opens clip B into the Viewer, with the playheads in the Viewer and in the Canvas both ganged to the same frame. The tab currently selected in the Viewer remains the selected tab, even though a new clip has been opened into it. The Open ganging option is useful when adjusting multiple clips that have color correction filters applied to them-as you move the playhead from clip to clip, the Color Correction tab updates to reflect the settings applied to whichever clip is at the current position of the playhead.
- **Gang**: When this option is selected, the offset between the current position of the playhead in the Canvas and the current position of the playhead in the Viewer is maintained as both playheads move together. This mode is useful for editing operations in which you want to mark In or Out points using durations defined by items or markers in the Timeline as your reference.

Audio

Audio Mixer tab in the Tool Bench
A new Audio Mixer tab in the Tool Bench has controls comparable to those of an automated hardware mixing console. Each audio track in the currently selected sequence is represented by a track strip, complete with solo and mute buttons, a stereo panning slider, and a volume fader. You can make fine adjustments to the audio in your program by manipulating these graphical controls in real time while you listen to your program play back. Final Cut Pro records the gestures you make with the mixing controls, adjusting the levels of clips in your sequence accordingly. Adjusting the levels of your tracks this way as you listen to them play back allows you to create mixes more quickly than does directly manipulating a track's volume overlays. The Audio Mixer tab has the following controls:

- track strip controls allowing real-time mixing and automation recording for volume and panning levels
- mute and solo monitoring controls
- master level, master mute, and mixdown controls
- individual track audio meters
- master output meters showing mixed levels for each assigned audio output
- controls to show and hide individual track strips
- up to four different mixer views, each with a different set of visible track strips
- the ability to turn on and off keyframe recording

Real-time automation recording
When the Record Keyframes checkbox in the Audio Mixer tab or in the General tab of the User Preferences window is selected, Final Cut Pro records all changes you make to audio controls during playback as keyframes in the corresponding parameter overlay of the audio clip you are adjusting. This is referred to as recording mixer and effects automation. You can record automation in real time during playback for

- volume and panning levels using the fader and pan controls in the Audio Mixer tab
- audio effects parameters using audio filter controls in the Filters tab of the Viewer

Keyframe thinning
A new Audio Keyframe Thinning pop-up menu in the General tab of the User Preferences window allows you to control how detailed keyframe automation is when recorded using the Audio Mixer or audio filter controls. There are three choices:

- **All**: Records the maximum number of keyframes possible while you move a track strip's fader or panning slider. The end result is a precise re-creation of the levels you set using the Audio Mixer. The drawback to this option is that you might end up with an extremely dense cluster of keyframes in the audio level overlays of the affected clips that can be difficult to edit later.
- **Reduced**: Reduces the number of recorded keyframes that are created when you move a track strip's fader or panning slider. The resulting level or panning overlay in the Timeline or Viewer is an accurate reproduction of the levels you set, but is easier to edit using the Selection or Pen tool.
- **Peaks Only**: Records only the minimum number of keyframes necessary to approximate the levels you recorded when moving a track strip's fader or panning slider. Keyframes recorded using the Peaks Only option reflect only the highest and lowest levels that were recorded. This is primarily useful when you want to record a minimum number of keyframes to edit later in the Timeline or Viewer.

Support for multichannel output and Mac OS X-compatible audio interfaces
New support is available for specifying Mac OS X-compatible audio interfaces for capture and output in the Audio/Video Settings window. New settings in the Audio Outputs tab of the Sequence Settings window allow you to define the number of audio output channels that are available to assign to audio tracks from your sequence, using whichever external audio interface or third-party video capture card is connected to your computer. By default, a stereo preset is enabled, and will work with the audio output built in to your computer, as well as with most DV camcorders and third-party video capture interfaces. If you have a more sophisticated audio interface specified in the Audio/Video Settings window that supports more than two channels of audio output, you can create a new preset to define these additional audio output channels.

Export multiple audio outputs to AIFF files
The Export Audio to AIFF(s) command in the File>Export submenu gives you the opportunity to export every audio output channel that's defined in the Audio Outputs tab of your sequence's settings as a separate AIFF file. You also have the option of saving each exported AIFF file at 24-bit resolution, which is useful because Final Cut Pro mixes the audio in your program at 32-bit internal resolution, even if your source audio is 16 bit. Since all audio calculations are made with higher precision to maximize the quality of your program's audio, using this command to export your audio preserves this quality.

New support for Audio Units
Final Cut Pro includes a set of Audio Units filters that you can use to adjust your audio clips. The Audio Units format is the standard Apple audio plug-in format for Mac OS X applications.

Third-party Audio Units are also available; before purchasing third-party Audio Units filters for use with Final Cut Pro, check with the third-party manufacturer to make sure they're compatible. Currently, Final Cut Pro only works with Audio Units filters that are capable of accepting mono audio as input, and can output a mono signal. Also, certain Audio Units filters that don't support certain properties required by Final Cut Pro for real-time playback will require rendering before playback. For information on how to install third-party audio filters, see the information that accompanied them.

Effects

New real-time variable speed effects
You can now apply variable speed to a clip. Also referred to as time remapping, this allows you to dynamically alter the speed of a clip, alternating among a range of speeds, in forward or reverse motion, throughout any duration you specify. Variable speed allows you to create sophisticated motion effects in which subjects appear to smoothly shift across a variety of different speeds, with hard or gradual transitions between each change. Speed changes you apply to clips in your sequence play back in real time. There are two ways you can make variable speed adjustments: m Timeline: One of the simplest ways to make variable speed changes is to use the Time Remap tool in the Tool palette to make adjustments to clips directly in the Timeline. As you work with this tool, an outline of your clip appears that shows you which source frame in the clip is being remapped to what time. Optionally, you can choose to display speed indicators and a keyframe

graph underneath that clip's track in the Timeline, to help you see what you're doing. m Time graph: You can also add, subtract, smooth, and adjust time remap keyframes using the time graph of the keyframe editor in the Timeline or in the Effects tab of a clip in the Viewer. Speed indicators in the Timeline Speed indicators underneath each track in the Timeline can be displayed, and show you the speed of clips in your sequence using tic marks. The spacing and color of these tic marks indicate the speed and playback direction of your clips. The speed indicators of clips in the Timeline update in real time as you make variable speed adjustments to clips in your sequence, showing you exactly how you're altering a clip's timing. There are no useradjustable controls in the speed indicator area. More real-time filters and motion effects Many more of the Final Cut Pro video filters, audio filters, and transition effects have been optimized to work in real time. New Timeline keyframe editor Keyframe editor areas can be displayed underneath each track in the Timeline. The keyframe editor shows you keyframe graphs for motion effects or parameters of filters applied to clips in your sequence. These graphs are identical to those found in the keyframe graph area of the Motion and Filters tabs in the Viewer. You can edit keyframes in the keyframe editor using the Selection and Pen tools. The keyframe editor can only display the keyframe graph of one effect parameter at a time. Keyframe graphs displayed in the keyframe editor are color-coded: motion parameter graphs are blue (matching the color of the blue motion bar), filter parameter graphs are green (matching the color of the green filter bar), audio levels are pink, and panning levels are purple.

New Frame Viewer tabs
Frame Viewer tabs in Tool Bench windows can be used to visually compare multiple frames from the same sequence. This is particularly useful when performing a color comparison of multiple clips in the same setting where the lighting attributes may have changed. In Final Cut Pro, you can open as many Frame Viewer tabs in as many Tool Bench windows as necessary to compare as many frames as you need. If you've arranged multiple Frame Viewers to accomplish a specific task, you can save your custom configuration by choosing Window>Arrange>Save Window Layout. For more information about saving window layouts, see the Final Cut Pro User's Manual or Final Cut Pro Help, Volume I, Chapter 4, "The Final Cut Pro Interface."

You can set a Frame Viewer tab to display the current frame, adjacent edit points, or the In and Out points in the Canvas and Timeline. You can also compare two frames within a single Frame Viewer tab using the split-screen buttons. You can split the screen either vertically or horizontally, or create a rectangular region showing the split as a picture-in-picture. You can configure the Frame Viewer to display those individual frames that are most useful for making comparisons in your project.

Improvements to the Color Corrector and Color Corrector 3-way filters
Additional features have been added to the Color Corrector and Color Corrector 3-way filters.

- The Hue Matching controls provide a way to adjust the color balance of the current clip, based on a specific hue, to match a similar hue in another clip. A common example of when you might use the Hue Matching controls is to match the flesh tones of an actor in two different shots that have different lighting.
- New Edge Thin and Softening controls in the Limit Effect section of the Color Corrector and Color Corrector 3-way filters allow you to make fine adjustments.

Compressor: Late Breaking News

- **Last Modified:** October 04, 2008
- **Article:** TA27418

- **Old Article:** 93159

Learn about the important late-breaking information for Compressor.

Products Affected

Final Cut Pro

Late-Breaking News About Compressor

For the latest information about product updates, tips and techniques, and qualified third-party devices, visit the Compressor website at http://www.apple.com/finalcutpro/compressor.html.

Circular Watermarks Look Elliptical With MPEG-2 Presets
If you have an image of a circle that you want to use as a watermark, it may end up looking elliptical. This is caused by a conflict between different pixel types-square and non-square- that are used between the source and output formats. To avoid this, when making the circle image, reshape it to approximate an ellipse. It will then be reshaped back into a circle.

Some Letters Appear Distorted When Using the Text Overlay Filter With MPEG-2 Presets
When using the Text Overlay filter with MPEG-2 presets, some letters-such as P and L-may not look correct. This is caused by a conflict between different pixel types-square and non-square- used between the source a
nd output formats. There is currently no work around for this situation.

Incorrect Preset Names Appear for Source Media Files Dragged From the History Drawer
If you drag a submitted job from the History drawer to the Batch table for resubmission, the Preset column displays the output filename of the media file as well as the preset name. This applies to presets for all encoders, but it has no impact on the resulting output media file.

Media File Codecs May Be Unrecognized When Working With Third-Party Codecs
Compressor supports any of the QuickTime codecs. However, if you attempt to transcode a file whose codec is not installed, you may see strange drawing behavior throughout the application. Typically, parts of your monitor are drawn in black, and movies don't appear in the Preview window. Make sure you have the proper codec installed for your source media file.

To see which codec was used to create your source media file:

1. Open your source media file in QuickTime Player.
2. Choose Window>Show Movie Info.
3. Click the More Info disclosure triangle and view the Format line. The Format line displays the codec name as well as the original frame size and depth format. Once you see which codec is used by your source media file, you can check to see if Compressor will recognize it.

To see whether Compressor will recognize your source media file's codec:

1. Open Compressor.
2. Either select an existing QuickTime preset or create a QuickTime preset.
3. Click the Video Settings button in the QuickTime Encoder pane to open the Compression Settings dialog.
4. Open the Codec pop-up menu at the top of the dialog and view the codecs listed.

If you don't see your source media file's codec listed, Compressor will not recognize your source media file.

Remote Destination User Names
If you are creating a remote destination, be sure to use UNIX-acceptable characters. User names containing characters inadmissible in UNIX filenames will not be recognized by Compressor.

Presets and Preset Groups Must Be Deleted One at a Time
Compressor only allows you to delete one preset or preset group at one time. If you select more than one preset or preset group, the Remove button becomes dimmed.

Presets Can Only Be Added to a Preset Group One at a Time
If you want multiple presets in a preset group, you must drag them from the Presets table to the preset group one at a time.

Presets Can Only Be Duplicated One at a Time
You cannot select multiple presets and duplicate them at the same time; the Duplicate button becomes dimmed. You must duplicate presets one at a time.

Presets Cannot Be Dragged Out of Preset Groups
Once you have dragged a preset into a preset group, you cannot drag it out again; however, you can drag it to another preset group. You can delete a preset from any group using the Remove button or Delete key.

No Notification Notice Is Given Before Deleting Presets or Preset Groups
There is no confirmation message when deleting a preset or preset group after you click the Remove button or press the Delete key.

Some Final Cut Pro Output Media Files Are Saved to the Root Boot Partition
If you are using Compressor to transcode a Final Cut Pro project and you choose Source as your destination, your resulting file(s) are saved to the root boot partition of your computer rather than to the source location.

Output Filename Identifiers in Droplets Appear in Symbol Format
Unlike the plain English filename identifier format used in the Destinations window, the Droplet window uses the % symbol followed by a letter to create filename identifiers.

The following symbols are listed with their identifiers:

- %B: Source file name
- %T: Preset file name
- %D: Date
- %E: Source file extension

iDisk Cannot Be Used as a Destination
If you want to save the output media file to a mounted iDisk volume, first save it to another destination, and then drag it to the mounted iDisk volume after it has been transcoded.

Important Information Regarding MPEG-2 Files Generated by Compressor and DVD Studio Pro

Timecode
DVD Studio Pro 1.5.2 doesn't recognize imported MPEG-2 files generated from Compressor when the timecode wraps in the following way for the following broadcast formats:

- NTSC: From 23:59:59:29 to 00:00:00:00
- PAL: From 23:59:59:24 to 00:00:00:00
- 24P: From 23:59:59:23 to 00:00:00:00

If your source media file is of a duration that you know will cause a timecode wrap to 00:00:00:00 and you intend to export the MPEG-2 output

media file to DVD Studio Pro 1.5.2, select the "Choose start timecode" checkbox in the MPEG-2 Encoder Video Format pane in the Presets window, and enter the timecode 00:00:00:00 in the related "Choose start timecode" field.

Chapter Markers
Chapter markers set in Final Cut Pro and transcoded in Compressor, or set directly in Compressor, will not be present in the imported MPEG-2 data in versions earlier than DVD Studio Pro 2. However, I-frames will be set where chapter markers were named. If you are using a version earlier than DVD Studio Pro 2, you have the following options:

Final Cut Pro native projects
You have the following options for Final Cut Pro native projects:

- Export QuickTime Movie: To preserve chapter markers, choose File>Export>QuickTime Export, and choose Compression Markers from the pop-up menu. You will not get the high quality and encoding options that Compressor provides, but you will keep your chapter markers.
- Export Using Compressor: If quality and encoder controls are important to your project, choose File>Export>Using Compressor to export your MPEG-2 media file. If you are using a version earlier than DVD Studio Pro 2, you can manually set the chapter markers directly in DVD Studio Pro.

Compressor native projects
You can set chapter markers using the Compressor Preview window, but they will not be preserved when exported to versions earlier than DVD Studio Pro 2. I-frames will be preserved. If you are using a version prior to DVD Studio Pro 2, you can manually set the chapter markers directly in DVD Studio Pro.

- Add DVD Studio Pro meta-data checkbox: Selecting this checkbox allows Compressor to parse specific MPEG-2 authoring information during the transcoding process to accelerate the import process into DVD Studio Pro 2. However, these MPEG-2 files will be incompatible with DVD Studio Pro 1.5 or earlier. Leaving the checkbox unselected means the information will be parsed later in DVD Studio Pro.

Note: MPEG-2 streams with additional DVD Studio Pro meta-data are only compatible with DVD Studio Pro 2 (or later). MPEG-2 streams processed with this checkbox selected will not be compatible with versions prior to DVD Studio Pro 2.

Reduced Bit Rate Recommended When Transcoding Certain Source Media Files
When transcoding MPEG-2 files using source media files at or near 120 minutes in duration as well as using AIFF to transcode audio, it is recommended that you reduce the bit rate of the 120-minute MPEG-2 presets slightly. Reducing the bit rate to 3.3 Mbps is recommended.

MPEG-2 Automatic Field Dominance Ordering Inconsistent
If you are using the Automatic Field Dominance setting in the MPEG-2 Video Format pane, the auto-detection mechanism sometimes picks the wrong field order (top or bottom). Autodetection chooses the correct field order when the source media file is using the DV codec, but with many other codecs it chooses the wrong field order (all of the Compressor default MPEG-2 settings use Automatic Field Dominance). To correct this inconsistency, create a new preset or duplicate an existing one, and set the field dominance to either "Top first" or "Bottom first" (rather than Automatic) to correspond to the field dominance of the source media file you want to transcode.

Transcoding With Compressor in Final Cut Pro
When you submit a Final Cut Pro project for transcoding, Final Cut Pro begins to render and transcode frames via Compressor. You have the option to pause or cancel this process in Final Cut Pro. The recommended method for pausing a Final Cut Pro to Compressor job is to use the Stop button in the Batch Monitor toolbar. The recommended method for stopping a Final Cut Pro to Compressor job is to use the Delete button in the Batch Monitor toolbar.

Changes in Network State May Affect Compressor's Ability to Submit Batches
If you change your network state while Compressor is running, you may find the Batch Window Submit button becomes disabled after the network state has changed. For example, moving your PowerBook from a corporate Ethernet network to a wireless network, or unplugging your laptop from a network to take it on the road, may result in this issue. This is easily resolved by quitting Compressor and reopening the application. If the problem persists, it is recommended that you restart your computer.

Archived - QuickTime 6.3: MPEG-2 Playback Component for Mac OS X Requires Update

In Mac OS X, after updating to QuickTime 6.3, you should also update the MPEG-2 Playback Component
This article has been archived and is no longer updated by Apple.
To be compatible with QuickTime 6.3, the MPEG-2 Playback Component (version 6.0) also needs to be updated.

The MPEG-2 Playback Component (version 6.3) is available to past purchasers via the QuickTime software update and within the Apple Store account used to purchase the MPEG-2 Playback Component.

Automated Software Update Installation (Mac OS X)

1. Choose Apple menu > System Preferences.
2. Choose View > QuickTime.
3. Click the Update tab.
4. Click Update Now.

iTunes 4.5 - Proxy Support

- **Last Modified:** May 01, 2004
- **Article:** TA27425

- **Old Article:** 93169

Learn about the proxy server support for iTunes 4.5.

Products Affected

iTunes Store, iTunes

iTunes 4.5 supports more types of proxy servers than previous versions.

Proxy Server Types that work with the iTunes Store

- Web proxy servers (HTTP)
- Secure Web proxy (HTTPS)
- SOCKS proxy servers
- HTTP/HTTPS proxy servers that require authentication
- Proxy bypass lists
- Proxy auto-configuration (PAC) files (Requires Mac OS X 10.3.2 on Mac)

Proxy Server Types that work with Internet lookup of Audio CD information (CDDB)

- Web proxy servers (HTTP)
- HTTP/HTTPS proxy servers that require authentication

Final Cut Pro: Quits When Opened With Some Third-Party Audio Units Installed

- **Last Modified:** April 28, 2006
- **Article:** TA27428

- **Old Article:** 93177

Some third-party Audio Units could cause Final Cut Pro to quit unexpectedly when you open it.

Products Affected

Final Cut Pro 5.X, Final Cut Studio, Final Cut Pro

Symptom

The application unexpectedly quits when you open it.

This happens when third-party Audio Units are installed.

Solution

Remove the suspect third-party Audio Unit from the folder it is installed in. They are usually installed in these folders:

- /Library/Audio/Plug-Ins/Components
- ~/Library/Audio/Plug-Ins/Components

Check the Audio Unit's documentation for additional information about their specific installation folders.

iSync doesn't sync with a Symbian OS phone after pairing

- **Last Modified:** July 27, 2005
- **Article:** TA27429

- **Old Article:** 93179

Products Affected

Mac OS X 10.2, Mac OS X 10.3, Mac OS X 10.4, iSync

When you try to sync your Symbian OS-based phone with your Mac using iSync (after successfully pairing it with your Mac), you may encounter one of the following messages or situations:

> "Could not establish connection to [name of the device]"
> "Can't synchronize contacts to [name of the device]: device is not available"
> Can't install iSync Agent due to a "security alert"

If this happens to you, here are some troubleshooting tips.

Note: iSync 2.0 is included with Mac OS X 10.4 Tiger.

Troubleshooting tips and tricks for iSync version 2.0 only (1.5 tips below)

- **Make sure you have enough free memory on your phone**
  When you first connect your phone to use with iSync, make sure you have enough free memory on the phone. If your phone's memory is full or nearly so, issues may occur. iSync will tell you if there is not enough free space to install iSync Agent ("iSync could not copy iSync Agent to your phone")—if you ignore this message or click Retry, all of your data might not sync (see "Make more memory available" below to resolve the issue).

- **Make more memory available**
  If you're short on memory, you can free some up by deleting unused or unwanted files from your phone. You should also turn your phone off and back on after you delete stuff.

Some of the unused or unwanted files you might want to consider are contacts, calendars, text messages that you no longer need, email, pictures, sounds, and movies. For example, after you install the iSync Agent and read the message that iSync sends to it, you can delete that message to free up about 200 KB of phone memory.

- **Reinstall iSync Agent**
  If you didn't successfully install iSync Agent due to low memory, follow these steps (after freeing up some memory) to ensure that all your data syncs:
  1. Select your phone in iSync, then choose **Remove Device** from the **File** menu.
  2. Turn your phone off and then back on.
  3. Locate iSync Agent on your phone (if it's there) and delete it(1).
  4. In iSync, choose **Add Device** from the **File** menu.
  5. Follow the onscreen instructions in iSync and on your phone to set up what content to sync.
  6. When setting up the phone, from the "For first sync" pop-up menu, choose "merge" or "erase" (your choice). Remember that selecting erase will erase any calendar and contact data currently on the phone and replace it with what is currently in Address Book and iCal.
  7. Sync!

     Tip: If you remove your phone from the list of devices in iSync, then quickly add it back and send iSync Agent to your phone again, you may see this alert message on your phone: "A problem occurred during the uninstallation." If this happens, wait 5 minutes before sending the agent to the phone again.

  Note: When memory is full on your phone, iSync Agent may close the connection but not mention that memory is full, which may cause some information to not sync. If you're phone is short on memory, try syncing an Address Book group with fewer contacts or fewer pictures (or, of course, freeing up even more memory on your phone). Don't forget to turn your phone off and then back on afterwards.

- **Make sure iSync Agent is installed correctly**
  If you installed iSync Agent after adding your phone to iSync and saw an "Installation Complete" message at the end of the installation (which includes opening the iSync Agent message on your phone and following its instructions), it should be installed correctly. If you don't see this message, iSync Agent may not be installed correctly. Follow the steps in "Reinstall iSync Agent," above.

  Tip: If you can't get the iSync Agent to install on your phone due to a "security" alert, check the phone's security settings to make sure they will allow application installation. Some phone models from certain providers come preset with security settings that could prevent you from installing iSync Agent or other applications. For example: On a Nokia 6630, go to Tools > Manager > Options > Settings > Software Installation, then set this option to ON. After installation of the iSync agent, you can turn this option off again if you prefer.

  These settings can vary from phone-to-phone. Consult the documentation that came with your phone for more information.

Troubleshooting tips and tricks for iSync version 2.0 and 1.5

- **Verify that Bluetooth is turned on**
  Sometimes Bluetooth on your Symbian OS phone may inexplicably get turned off. If your phone isn't syncing, try turning your phone off and then back on. Then confirm that Bluetooth is on before trying to sync again.

- **Try syncing again**
  If you see an alert message that says, "Cannot connect to the devices. Can't connect to channel on devices (Server might be down)" after installing iSync Agent, wait one minute, and then try syncing again.

- **Avoid syncing with third-party applications on the phone**
  It's OK if you use third-party syncing applications other than iSync on your phone. Just remember not to run them when iSync is syncing. Some might not work with iSync.

- **Authorize connection settings on the phone**
  Each time you sync with a Symbian OS-based phone via Bluetooth, you'll need to reply to an authorization message on the phone, even if the phone is properly paired. You might miss this message on the phone. If you miss or reject these messages, iSync may not operate correctly and display this message:

  "Agent not running on the device"

  To avoid having to reply to the phone's authorization messages, authorize your computer to communicate with your phone in your phone's Bluetooth settings. Check the documentation that came with the phone for more information.

  To see if this is an issue, open iSync and click Sync Now. Watch the phone closely. If the authorization window appears, grant the authorization.

- **Update the phone's firmware**
  Some phones may require that you update its software to function properly. Contact the phone manufacturer or service provider about

update availability and service options. Be sure that you try switching the phone off and then back on to see if it resolves the communication issue. You may need to do this each time you sync the phone.

- **Check your Bluetooth adapter**
  If you're using a Bluetooth adapter, some of them (including any D-Link DBT-120 USB Bluetooth adapter prior to revision B2) do not work with simultaneous multiple connections. This means you cannot use more than one Bluetooth device at the same time. Other applications, such as Address Book, HotSync Manager, Ericsson Clicker, or any other application communicating over Bluetooth, could also interfere with iSync.

  If you have lots of Bluetooth devices, you can check out what's going on in the Bluetooth preference pane in System Preferences. Devices that appear in bold are active. If more than one device is active, try deactivating all other devices except for your phone, then try to sync again.

  Some Bluetooth adapters may not be available after restarting your computer. In most cases, disconnecting and reconnecting the adapter will make it active again.

Troubleshooting tips and tricks for iSync 1.5 only

- **Check for personal firewalls**
  A personal firewall limits access to your computer through network connections on certain ports. See "iSync 1.1: Some Phones May Not Sync if Firewall Is On" for more information.

1. For additional information on how to remove applications from your phone, please consult the documentation that came with your phone. **Note**: If you are attempting to uninstall iSync Agent from a Sony P900 phone and are unable to remove it successfully, consider performing a master reset of the phone. Keep in mind that this will erase all of your contacts, calendar items, and other personal data on your phone—please consider backing up this data first. Consult the documentation that came with your phone for more information.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

iSync: Use Caution Before Choosing Reset All Devices Command

- **Last Modified:** February 04, 2004
- **Article:** TA27430

- **Old Article:** 93182

To avoid data loss, use caution before choosing the Reset All Devices command in iSync.

Products Affected

iSync

The Reset All Devices command in iSync can be a useful tool to resolve differences between data on your computer and other devices. However, care must be exercised when using this feature.

When you choose Reset All Devices, data on your synced devices (mobile phone, Palm, iPod, and so forth), is erased and replaced with data from Address Book and iCal. This data can come from the computer or your .Mac (pronounced "dot Mac") account.

Important: Any information on the device that is **not** in Address Book or iCal is erased when you choose the Reset All Data command.

Other information may also be lost if it is not synced, such as voice dial tags, speed dial information, custom ring tags, and so forth.

For this reason, compare data on the computer with data on your synced devices before choosing the Reset All Devices command.

Visit the Apple Store online (1-800-MY-APPLE), visit a retail location, or find a reseller.

Final Cut Pro 4: Compressor - Crop Fails if Video Track 1 Is Not the Destination Track or Is Locked

- **Last Modified:** October 23, 2006
- **Article:** TA27431

- **Old Article:** 93184

Compressor will not be able to complete a crop operation on the video if the V1 track is not the destination track, or if it is locked in Final Cut Pro 4.

Products Affected

Final Cut Pro

Symptom

The crop settings made in the Compressor Preview window are not applied.

Parts of the resulting video clip are black.

Solution

Update to Compressor 1.0.1 or later. Use either the Software Update option in System Preferences or see "**Final Cut Pro 4.1**" for the update.

Some Address Book fields don't sync with Sony Ericsson P800 via iSync

- **Last Modified:** October 04, 2008
- **Article:** TA27434

- **Old Article:** 93190

If you have already synced contacts to your P800 mobile phone from another source, like Microsoft Outlook on a PC, some of the fields may not sync to Address Book when you use iSync.

Products Affected

iSync

If you have lost data on your P800 because of this, you may be able to recover most, if not all, of your contact information by recovering the information from the application you used before iSync.

After the data has been restored, follow these easy steps to use the P800 with iSync:

1. Deselect the option to only synchronize contacts with phone numbers in the phone settings of iSync. This prevents iSync from ignoring contacts without phone numbers. However, this will prevent iSync from removing the contacts with unrecognized information from the phone. You may still have contacts in Address Book that do not have the same information as on the P800. See Additional Information below.
2. After the initial sync with iSync, verify the data integrity. For contacts that do not have the same information in Address Book and the P800, enter the correct information in Address Book.
3. It is very important not to use the Reset All Devices or Revert to Last Sync commands in iSync until you verify that the data is the same on the phone and in Address Book. If you use either command before this is completed, you could lose your contact information.
4. Once you have verified the data on the phone and Address Book are the same, click Sync in iSync.

You can now sync without worrying about data loss.

Tip: You should only sync a device using iSync. Do not also sync it with other applications on a Mac or Windows-compatible computer.

Additional Information

This happens because the data from the other application is not in a format recognized by iSync. iSync recognizes data that comes from the phone, or is in that same data format. If it is not in that format, such as information from PC Microsoft Outlook, iSync will not recognize the proper fields.

A contact may sync to Address Book with no phone numbers even if the contact has numbers on the P800. If you sync a second time with the option to "Only sync contacts with phone numbers" selected, the contact will be deleted from your P800 because, according to Address Book, the contact has no phone number data. This can also occur if you manually import vCards exported from a program such as Microsoft Outlook.

iTunes 4: "Unsupported Compression Scheme" Message

- **Last Modified:** September 18, 2003
- **Article:** TA27436

- **Old Article:** 93192

Some noncompliant proxy servers do not correctly pass CDDB (CD database) information. This can cause an "Unsupported Compression Scheme" message to appear.

Products Affected

iTunes

Symptom

When iTunes checks the Internet for a CD's title and track names, this message appears: "Unsupported Compression Scheme"

Solution

Either discontinue using the proxy server or contact the proxy server administrator for assistance.

iChat AV: External Mic May Be Needed With Some iMac Models

- **Last Modified:** December 18, 2003
- **Article:** TA27439

- **Old Article:** 93204

Use an external microphone with some iMac models for best results.

Products Affected

iMac, iChat

Symptom

The sound volume is low when in a video conference.

This happens when using the built-in microphone with certain iMac computers.

Solution

Connect and use an external microphone when using iChat AV with an iMac (with CRT display).

If using an iSight camera, use the iSight's built-in microphones.

Archived - LiveType: Frequently Asked Questions (FAQ)

Learn about solutions to common issues for LiveType included with Final Cut Pro 4.

Products Affected

Final Cut Pro

This article has been archived and is no longer updated by Apple.

Questions answered in this document:

1. Some fonts appear to shake in the preview movie.
2. My images appear pixelated.
3. LiveType doesn't open anymore.
4. The motion is not smooth on my NTSC monitor.
5. When I bring titles into my nonlinear editor (NLE) or compositing program, the characters appear squashed or the aspect is wrong.
6. A keyframe is "stuck" at the beginning or end of an effect, and I can't select it, move it, or delete it.
7. When I apply an effect with a glow or shadow change, I don't see a change in the Live Wireframe Preview in the Inspector.
8. When I change certain attributes of a track, they don't seem to have any effect.
9. I can't select an element or character.
10. I keep accidentally selecting the texture, image, or movie I created on a track as a background image.
11. When I have a lot of elements in the Canvas, everything slows down.
12. The .afp characters I created appear squashed or out of their proper aspect ratio when typed into the Canvas.
13. How can I create smaller .afd files?
14. The proxy images (.afps) for each character I created are blank.
15. The .afp characters I created don't rest on the track.
16. I created a LiveFont, but the characters type out with odd spacing in LiveType.

Question 1: Some fonts appear to shake in the preview movie.

Answer: Because LiveType uses a small sampling for low-quality previews, some images may be missing pixel data that provides smoother movement. Increase your quality settings in the Project Properties dialog to produce smooth results.

Question 2: My images appear pixelated.

Answer: If you render a preview, your movie is displayed in low resolution and appears a bit pixelated. Also, if you size your elements beyond their original size, some pixelization may occur.

Question 3: LiveType doesn't open anymore.

Answer: It is possible to save a set of default settings that prevents LiveType from opening. Try erasing your default settings file: \\Library\\Preferences\\LiveType Pro Defaults.dat. Your configuration reverts to the original LiveType settings. This is essentially the same as choosing LiveType > Settings > Clear Settings within the application.

Question 4: The motion is not smooth on my NTSC monitor.

Answer: Use the fielding option for the smoothest motion.

Question 5: When I bring titles into my nonlinear editor (NLE) or compositing program, the characters appear squashed or the aspect is wrong.

Answer: Make sure to set the project properties in LiveType according to the size and pixel aspect your NLE uses. Some NLEs require the correct frame size even if the title doesn't use the entire frame. Square pixels take a value of 1, and NTSC pixels take a value of .9.

Question 6: A keyframe is "stuck" at the beginning or end of an effect, and I can't select it, move it, or delete it.

Answer: Try increasing the Timeline zoom, to see whether you can select and drag the keyframe away from the beginning or end of the effect. Because the beginning and ending keyframes cannot be deleted, it is possible to slide an internal keyframe to the far end of the effect so that it cannot be moved, regardless of the Timeline magnification.

To remedy this, do the following:

1. Select the beginning or ending keyframe that's obscuring the other keyframe.
2. From the **View** menu, choose **Go To** and the choose **Next Keyframe** (or **Previous Keyframe**) to select the "lost" keyframe.
3. Choose Edit > Cut.
4. Move the playhead and from the Edit menu, chose **Paste**.

Question 7: When I apply an effect with a glow or shadow change, I don't see a change in the Live Wireframe Preview in the Inspector**.**

Answer: The wireframe boxes in the preview show the basic shape of each glyph, and aren't changed by Style settings. Other preview options, such as a RAM preview or preview movie, reveal shadows and glows.

Question 8: When I change certain attributes of a track, they don't seem to have any effect.

Answer: Because effect parameters override track parameters, you may be trying to adjust a parameter that is being overridden. Disable the effects associated with that track to see whether the attributes become active again. If so, the solution is to change the effect parameters.

Question 9: I can't select an element or character.

Answer: Make sure that Lock Position is not selected in the Layout menu. When you add a texture or background movie, it is locked by default.

Also, you may be clicking an element that uses the entire Canvas. Try zooming out to view beyond the edge of the Canvas to reveal its bounding box.

Consider the layer order, too, when you want to select an element on the Canvas. If one element gets in the way of selecting another, use the Timeline to select the track underneath, and highlight glyphs in one of the text-entry boxes in the Inspector.

Question 10: I keep accidentally selecting the texture, image, or movie I created on a track as a background image.

Answer: From the **Layout** menu, choose **Lock Position** to prevent the element from being selected.

Question 11: When I have a lot of elements in the Canvas, everything slows down.

Answer: See Chapter 8 of the LiveType for Final Cut Pro 4 manual, "Previewing and Fully Rendering Your Titling Movie," for ways to optimize preview performance.

Question 12: The .afp characters I created appear squashed or out of their proper aspect ratio when typed into the Canvas.

Answer: Set the aspect value in the FontScript to the same pixel aspect as the movies you have created. Square pixels take a value of 1, and NTSC pixels take a value of .9.

Question 13: How can I create smaller .afd files?

Answer: You can set the RGB and Alpha values in the FontScript to a lower number to obtain more compression. Also, try reducing the number of frames in your movies. You can consider lowering the recommended 800 x 800 resolution of your font. If you know that you'll never go beyond a size of 250 points, you can generate the font at 400 x 400, reducing your file size substantially.

Question 14: The proxy images (.afps) for each character I created are blank.

Answer: This probably indicates that a proper alpha channel was not used when creating your character movies, and LiveType is displaying the entire frame as blank.

Another scenario could be that your .afd component is installed, and that your first frame contains no pixels, so all you need to do is play the movie or move your playhead forward in the Timeline.

Question 15: The .afp characters I created don't rest on the track.

Answer: Your Lowerleft values are not correct.

Question 16: I created a LiveFont, but the characters type out with odd spacing in LiveType.

Answer: Your width settings for each character do not match in the FontScript.

iChat AV: Only right speaker makes sound during audio or video chats

- **Last Modified:** January 31, 2008
- **Article:** TA27443

- **Old Article:** 93214

Products Affected

iSight, Mac OS X 10.4, Mac OS X 10.3, Mac OS X 10.2, iChat

PowerBook G4, iBook, and MacBook Pro computers only make sound through the right speaker, and the volume may seem lower. This prevents feedback through the built-in microphone. This document applies to iChat AV, Mac OS X 10.2.5 or later, and iSight or any FireWire IIDC compatible video camera.

To hear sound from both channels, use headphones or external speakers (such as USB speakers).

iMovie: "Your project is unreadable" Message

If an iMovie project file becomes unusable, you may see a message that says "Your project is unreadable."

Products Affected

iMovie

This article has been archived and is no longer updated by Apple.

Symptom

When you try to open a project, this message appears: "Your project is unreadable."

Solution

If the project file is unreadable, you may be able to recover it using the methods below.

Method 1 (for all versions of iMovie)

1. Create a new project in iMovie.
2. Drag the contents of the Media folder of the original project folder into the shelf of the new project.
3. Re-assemble the project by dragging clips from the shelf to the timeline.

Method 2 (for iMovie 3 or higher)

1. Open the iMovie project folder in the Finder and locate the reference .mov file at the root level of the project folder.
2. Create a new project in iMovie.
3. Drag the .mov file from the original project folder into the new iMovie project timeline to import the original project contents as a single clip.

Warning: If you use this method to recover your project, do not delete the original project folder or the items in it. The reference movie relies on these files.

iChat AV: System requirements

- **Last Modified:** March 29, 2004
- **Article:** TA27456

- **Old Article:** 93245

Learn about the system requirements for iChat AV.

Products Affected

iChat

For audio

- Mac OS X 10.2.5 or later (Mac OS X 10.3 or later for iChat AV 2.1 or later)
- Any PowerPC G3 microprocessor or later
- iSight, or any microphone
- 56 kbit/s modem connection

For video

- Mac OS X 10.2.5 or later (Mac OS X 10.3 or later for iChat AV 2.1 or later)
- PowerPC G5, PowerPC G4, and 600 MHz or faster PowerPC G3 microprocessors
- iSight or any FireWire based camera
- Cable, DSL, or other broadband Internet connection

iSync: Does Not Sync With Data on SIM Card

- **Last Modified:** November 14, 2003
- **Article:** TA27457

- **Old Article:** 93248

iSync is designed to synchronize data from a mobile phone's memory. It does not synchronize with data stored on a phone's subscriber identity module (SIM) card.

Products Affected

iSync

Symptom

Some of the contacts on your phone are not copied from the phone to the Address Book application.

Solution

iSync is designed to synchronize with the data in the phone's memory and will not synchronize with the data stored on the phone's SIM card.

Some mobile phones allow you to move contacts between the phone's memory and the SIM card. This permits you to move the data with the SIM card to another phone. Consult your phone's documentation for information about how to copy or move contacts from the SIM card to the phone's memory to synchronize this data using iSync.

Final Cut Pro and Final Cut Express: Custom Window Layouts Don't Appear

- **Last Modified:** October 04, 2008
- **Article:** TA27458

- **Old Article:** 93249

Three issues can cause custom layouts not to appear in the Window > Arrange menu.

Products Affected

Final Cut Pro, Final Cut Express

Symptom

Custom window layouts don't appear in the Window > Arrange menu.

There are three issues that can cause custom layouts not to appear:

1. The Dock was made larger or was moved after a layout was created .
2. Final Cut Pro or Final Cut Express window(s) spanned across monitors on a dual-monitor system when you saved the layout.
3. You logged in as a NetInfo user.

Solution

Try the following for issue 1:

- From the **Apple** menu, choose **Dock**, and the choose **Turn Hiding On** (Option-Command-D).
- If the Dock has been resized or moved, create a new layout.
- If the Dock has been resized or moved from the **Window** menu, choose **Restore Window Layout** and then save new the readjusted layout with same name.

Try the following for issue 2:

- Never save a window layout that overlaps another Final Cut Pro or Final Cut Express window or overlaps monitors.
- From the **Window** menu, choose **Restore Window Layout** and then save new readjusted layout with same name.

Try the following for issue 3:

- From the **Window** menu, choose **Restore Window Layout**.

iChat's picture-in-picture and Snapshot is "mirrored"

- **Last Modified:** July 24, 2007
- **Article:** TA27459

- **Old Article:** 93252

Products Affected

iSight, iChat

Views from your iSight camera appear flipped or reversed to you, like a mirror image. These views include:

- In the "Preview" window in Preferences under the Video tab
- The picture-in-picture view while in a conference
- The Snapshot
- The preview in the First Time User interface

This is by design. The effect is similar to what you would see if you were looking into a mirror.

Your image will appear in its natural, unreversed state to those with whom you chat.

iPhoto: Color, Black and White Prints Appear Garbled or Distorted

- **Last Modified:** November 18, 2003
- **Article:** TA27460
- **Old Article:** 93253

Prints you order through iPhoto may appear garbled or distorted if you imported the photos in CMYK or grayscale format.

Products Affected

iPhoto

Symptom

Prints you ordered using iPhoto are garbled or distorted. See Figures 1 and 2 below. The photos appear normally in iPhoto.

This happens if you import files from photo editing applications, such as Photoshop, that can export in CMYK or grayscale format.

Figure 1 Black and white photo imported in grayscale

Figure 2 Color photo imported in CMYK

Solution

Import images from other applications only in JPEG format with RGB color. iPhoto requires RGB color to format the image for uploading when ordering prints or books.

Additional Information

In some cases the print order may be automatically canceled; however, if the print order is printed and shipped, the final prints will appear garbled

or distorted. Photos imported directly from cameras should not be affected by this issue since RGB JPEG is the standard export format for most digital cameras.

LiveType: Blank Templates Do Not Appear in Template Browser

- **Last Modified:** July 07, 2003
- **Article:** TA27461

- **Old Article:** 93256

When previewing templates in LiveType's Template Browser, the category named Blank does not appear as suggested in LiveType Help.

Products Affected

Final Cut Pro

Symptom

When previewing templates in LiveType's Template Browser, the category named Blank does not appear as suggested in LiveType Help.

Solution

The Blank category is not included in LiveType 1.0.

As an alternative, Page 34 of LiveType Help explains how to create your own template categories which may be used as starting points.

Final Cut Pro 4: Out of Memory Alert With Digidesign Audio Cards

- **Last Modified:** February 16, 2011
- **Article:** TA27464

- **Old Article:** 93260

This article has been archived and is no longer updated by Apple.

Final Cut Pro may report an out of memory alert when opened if a Digidesign audio card is installed.

Products Affected

Final Cut Pro

Symptom

When opened, Final Cut Pro displays an "out of memory" alert and then quits.

Solution

In the Sound pane of the Mac OS X System Preferences, switch the sound output device to "Built-in audio controller."

If the issue persists, remove the Digidesign audio card.

Updating to Mac OS X 10.3 Panther should also address this.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

iPhoto: "Unreadable Files" Alert

- **Last Modified:** June 11, 2007
- **Article:** TA27468

- **Old Article:** 93275

An alert may appear while importing pictures that says there was an unreadable file and that some of the pictures were not imported because they were an unrecognized file type or the files may not contain valid data.

Products Affected

iPhoto

Symptom

While importing pictures into iPhoto an alert appears with this message:

> "Unreadable Files: The following files could not be imported (they may be an unrecognized file type or the files may not contain valid data)"

Figure 1 Unreadable file alert

A list of files that were not imported appears as part of the alert.

This happens If you try to import items that are not pictures, or files that are damaged, or when the computer's hard disk is full.

Solution

1. If only some or none of the photos were imported, make sure they are actually photos. Note which files were not imported. If possible, open them with another application, such as Preview, which can open the same type of image files that iPhoto can. If the file cannot be opened in another graphics application, then it is probably not a graphic file, or the file is damaged.

   If any of the photos were taken with a QuickTake 100 or 150 camera, see technical document 61047: "**Mac OS X: Unable to Open QuickTake 100, 150 Pictures**".

2. This alert also appears when there is no available disk space. Verify the available disk space on the startup disk by selecting the disk icon in the Finder and choosing File > Get Info. The amount of free space on the disk appears next to Available (see Figure 2).

Figure 2 Available disk space in Get Info

If there is minimal space available on the hard disk , drag files or applications you no longer need to the Trash and empty the Trash. Make sure any important files are backed up prior to deleting them.

If importing files from a hard disk, see technical document 61015: "**iPhoto: About Importing Pictures From Hard Disk and Available Space**"

iPhoto, Aperture: Minimum Picture Resolution For Ordering Quality Prints

- **Last Modified:** November 27, 2006
- **Article:** TA27470

- **Old Article:** 93279

This document lists the minimum picture resolution needed for specific print sizes when ordering prints through iPhoto or Aperture.

Products Affected

iPhoto

For quality prints, these are the minimum resolutions for the following print sizes when ordering prints through iPhoto or Aperture.

Print Size (inches)	Pixel Dimensions
Wallet	450 x 300
4x6	900 x 600
5x7	1050 x 750
8x10	1500 x 1200
16x20	1600 x 2000
20x30	1600 x 2400

Higher resolutions than these will generally result in higher quality prints at a given size.

iPhoto, Aperture: How to Use a Coupon or Promotional Offer

- **Last Modified:** June 12, 2007
- **Article:** TA27473

- **Old Article:** 93285

This document explains how to use a coupon or promotional offer when placing a photo order.

Products Affected

Aperture, iPhoto

Before submitting the final photo order, you have the option to enter a promotional offer or coupon code.

To use the offer:

1. Access the order panel (in iPhoto or Aperture):
    - In iPhoto:
        1. Select your book, card, or calendar in the source list.
        2. Choose the **Buy Book**, **Buy Card** or **Buy Calendar** button from the bottom of the iPhoto window or select an image or images in the Library and choose **Order Prints**.
    - In Aperture:
        1. Select your book in the Project Panel.
        2. Select the **Buy Book** button from the bottom of the Aperture window or select an image or images and choose **Order Prints** from the **File** menu.
2. Choose the **Use Coupon** button.
3. Enter the promotional code in the coupon code field and click the Validate button.
4. Once the code is validated, you can select the previously-grayed **Use Coupon** button.

LiveType: Installing and Managing LiveFont and Object Data

- **Last Modified:** October 04, 2008
- **Article:** TA27475

- **Old Article:** 93294

Some data used by LiveType has considerable storage requirements and may not need to be installed in all cases. It is not automatically installed when installing Final Cut Pro 4.

Products Affected

Final Cut Pro

When you install Final Cut Pro 4, LiveType is installed, too. Additional data for LiveType, such as LiveFonts and Objects, though, are not automatically installed because of the disk space they require. If you do not install the packages from the two LiveType Data discs after installing Final Cut Pro and restarting your computer, you may see a message titled "Missing LiveType Data" and a list of files that are not installed (see Figure 1) while working in LiveType.

Figure 1 Missing LiveType Data message

If you choose the first option, "Install missing LiveType Data now," LiveType will prompt you to insert the LiveType Data discs, and will install the necessary data on your computer's hard disk. Additionally, if you select the "as Aliases" and "Install missing LiveType Data now" options, LiveType will create aliases on your computer's hard disk instead of the actual data, and ask you where you want to save the data. This can be useful if you do not wish to have the LiveType data stored on your computer's hard disk due to the considerable storage space needed for this information.

If you choose the second option, "Use Poster Frames for Tracks with missing Data," LiveType will make due without the necessary data and render your project with just a single proxy frame that represents the LiveFont or Object. This can be useful while developing your LiveType project, but may not be desirable for final output. If you choose this option, the poster frame will be static--LiveFonts and Objects will not be animated as usual.

Another method of managing the storage requirements for LiveFonts and Objects is to install them only as needed, and then remove them after rendering to free up disk space on your computer's hard disk. Here's a typical workflow using this option:

1. Create your project as you normally would. When you are ready to render, continue to the next steps.
2. Select the LiveFonts used in your project from the list in the Media Browser.
3. In the lower-left corner of the Media Browser, there are two small buttons.
4. Click the one on the left to install the selected LiveFonts (Figure 2).
5. Perform steps 2 through 4 for Objects in your project.
6. When all LiveFonts and Objects used in your project have been installed, you're ready to render.
7. Optionally, after you have completed and rendered your project, you can remove the installed items by selecting them as above then

using the other button in the lower-left corner of the Media Browser to remove them from your hard disk.

You can tell which Objects and LiveFonts are installed by checking the Installed column in the Media Browser. In some cases, it may be necessary to quit and reopen LiveType after installing LiveFonts or Objects before their Installed status changes in the Media Browser.

iSight: Video Editing Software Stops Responding When Two Cameras Are Connected

- **Last Modified:** October 04, 2008
- **Article:** TA27477

- **Old Article:** 93300

Video editing applications such as Final Cut Pro, Final Cut Express, and iMovie can stop responding (or "hang") if both an iSight camera and a DV video camera are connected when you open the application.

Products Affected

Final Cut Pro, iSight, iChat, iMovie

Symptom

The application stops responding, and the pointer turns into a progress indicator (looks like a spinning disc or beach ball).

Solution

Update to Mac OS X 10.2.8 or later.

See document 25525, "**Mac OS X: About the Mac OS X 10.2.8 Update (Combo)**" for Mac OS X 10.2.8. Mac OS X 10.3 Panther can be purchased from the **Apple Store**.

Archived - DVD Studio Pro: Themes and Button Shapes Disappear During Simulation of an iDVD Project

When a menu has never been opened or rendered in iDVD, the information in the project file is incomplete. The drop zone artwork or shapes will not be imported.
This article has been archived and is no longer updated by Apple.

Symptom

Menus lack backgrounds and shapes when viewing an imported iDVD project in the DVD Studio Pro 2 Simulator.

This can occur if the menu was created but never viewed in iDVD.

Solution

Render the menu and restart the simulation.

To render the menus, open the project in iDVD and individually open and view all menus that are in the project. Changing the menus is not necessary, they only need to be opened and viewed.

Save the project in iDVD and reimport the project into DVD Studio Pro. It should now simulate correctly.

Final Cut Pro 4, Soundtrack: "-4960 Error" When Opening the Application

- **Last Modified:** February 16, 2011
- **Article:** TA27482

- **Old Article:** 93311

This article has been archived and is no longer updated by Apple.

Soundtrack and Compressor may not open if complete identity information is not present in the Address Book database.

Products Affected

Final Cut Pro, Soundtrack Pro

Symptom

You see an alert message that contains "Error -4960" when opening Soundtrack and Compressor, which are part of Final Cut Pro 4.
or
Soundtrack or Compressor quit unexpectedly when opened.

This can happen if the registration phase of the setup assistant is skipped.

Solution

Update to Soundtrack 1.1. The update can be obtained via the Software Update pane in System Preferences.

If you are not able to update, follow these steps:

1. Open the Address Book program (located in the Applications folder)
2. From the **Card** menu, choose **Show My Card**, or from the Card menu, choose **This is My Card** to identify or designate your identity card.
3. Edit your identity card to have a state/province/region name that is two or more characters in length.
4. Quit Address Book.

Note: If you have multiple street addresses in your Address Book identity card, be sure to fill in the state (or "province", "region", etc) field for each address.

Final Cut Pro 4: How to Update to 4.1

- **Last Modified:** February 16, 2011
- **Article:** TA27486

- **Old Article:** 93321

This article has been archived and is no longer updated by Apple.

This document describes how to update to Final Cut Pro 4.1.

Products Affected

Final Cut Pro

To update from Final Cut Pro 4.0 to Final Cut Pro 4.1, follow these steps:

1. From the **Apple** menu, choose **System Preferences**.
2. From the **View** menu, choose **Software Update**.
3. Click Update Now.
4. In the Software Update window, select the items you want to install, then click Install.

   Note: Before you can see the Final Cut Pro 4.0.1 updates, you must first install the Pro Applications Support package, then repeat step three again. Updates for Compressor, Soundtrack, Cinema Tools, and LiveType are also available.

5. Enter an administrator account password when prompted.
6. After the update is complete, restart the computer.

The Final Cut Pro updates can also be downloaded from the Final Cut Pro download page (http://www.apple.com/finalcutpro/download/).

Final Cut Pro 4: Irregular Audio Rates and A/V Sync in DV Clips

- **Last Modified:** June 14, 2007
- **Article:** TA27490

- **Old Article:** 93326

This document discusses why a DV clip may have an audio rate that differs slightly from the expected rate.

Products Affected

Final Cut Pro

Many DV camcorders and decks record audio at sample rates other than the true sample rates of 32 kHz or 48 kHz. Variations in equipment from different manufacturers can result in slight but significant variances from these standard sample rates.

The QuickTime DV capture tools expect the sample rate of an incoming DV stream to contain locked audio at a sample rate of exactly 32k or 48k. When this rate differs, the audio and video will drift out of sync after several minutes of playback. While not perceptible on short clips, longer clips will generally display a visible drift in A/V sync after 15 minutes or so, depending on the difference between the expected and actual sample rates.

In previous versions of Final Cut Pro, the "Sync Adjust Movies Over [n] Minutes" option could be enabled in the preferences, triggering an adjustment in the audio sample rate based on the amount of audio recorded to disk during capture.

In Final Cut Pro 4, this preference has been replaced by automatic audio rate analysis, specific to DV media. This new rate analysis mechanism accurately determines the real sample rate, as recorded by the camera/deck, by examining the DV stream directly. For media captured in Final Cut Pro 4, this analysis is performed during capture, with the resulting media file updated to permanently reflect the actual sample rate. DV media files captured in previous versions of Final Cut Pro will be analyzed when imported or opened, with the actual sample rate used within Final Cut Pro; but no changes are written to the media file itself.

Note: This rate adjustment will not have any effect on loss of A/V sync caused by capturing over a segment of blank or bad tape.

Final Cut Pro 4: A/V Sync Issues When Capturing DV Clips Over Blank or Bad Tape

- **Last Modified:** December 02, 2003
- **Article:** TA27491

- **Old Article:** 93327

Capturing over a segment of blank or bad tape will effect the A/V sync of captured DV clips in Final Cut Pro.

Products Affected

Final Cut Pro

Users may notice issues with A/V sync capturing from DV tape using FireWire, when the tape in question has blank areas, or is degraded to the point where it cannot be read by a deck or camera. When a capture spans one of these breaks in content (e.g. recorded media / blank tape / recorded media) the sync between the audio and video following the break will generally be offset by the duration of the break.

While capturing DV media over FireWire using Final Cut Pro, QuickTime will extract the audio data from the incoming DV data stream, writing it to disk in parallel with the video data as a part of a standard QuickTime movie. This process necessitates that audio and video are processed separately once the DV data stream has reached the computer, and assumes that a consistent stream is received during capture.

When capturing from a DV tape, most FireWire/DV decks and cameras will temporarily stop sending data over FireWire when they encounter blank or unreadable tape, resuming transmission when valid data is encountered once again. This is different than capturing over a traditional video connection (composite, component, SDI, etc..), where the source device is required to output a constant video signal, generated from any data read from the source tape, or using an internal signal generator when no data is present.

During this pause in transmission for DV/FireWire devices, audio continues to be processed/generated by QuickTime, but video does not. This results in the sync between the audio and video being offset by the amount of time that the source deck or camera stopped transmitting data.

It is because of this behavior that capturing over blank or bad tape using DV/FireWire devices is not supported. To work around this situation, it is suggested that the segments between the blank/bad tape sections be captured individually. Alternatively, the bad tape in question can be dubbed to another tape using a traditional video connection (composite, component, SDI, etc...) to generate empty media for the blank or bad segments of tape.

iDVD: How Much Video Can I Put on a DVD-R Disc?

Different versions of iDVD allow different lengths of video to be included on a disc.

Products Affected

iDVD

This article has been archived and is no longer updated by Apple.

Digital video stored on DVD-Video discs is encoded in the MPEG-2 format. This is true for DVDs made with iDVD as well as retail DVDs. The MPEG-2 format offers excellent video quality while compressing the DV format files of your iMovie projects to fit into a smaller space.

The quality of the MPEG-2 encoder has increased with each version of iDVD, allowing better quality and better compression. This means you can fit more video on the same size DVD-R discs with later versions of iDVD as illustrated in this table:

iDVD Version	Encoder Comparison
iDVD 6	Up to 2 hours
iDVD 5	Up to 2 hours
iDVD 4	Up to 2 hours
iDVD 3	Up to 1.5 hours
iDVD 2	Up to 1 hour
iDVD 1	Up to 1 hour

iDVD has built-in support for a wide variety of DVD media formats — including DVD-R, DVD-RW, DVD+R, DVD+RW, and DVD+R DL.

- DVD-R: Can be used only once. This is the recommended media for iDVD, since it's compatible with most DVD players and computers on the market today. It can hold about 4.38 gigabytes (GB).
- DVD+R: Can be used only once. These discs, too, can hold about 4.38 GB.
- DVD-RW: Can be used more than once. RW stands for "rewritable." These discs can hold about 4.38 GB.
- DVD+RW: Can be used more than once. These can hold about 4.38 GB. These discs may not be viewable in all DVD players.
- DVD+R DL (Double Layer): Can store almost twice as much content as single-layer discs, but cannot be viewed in older DVD players.

As you author your DVD's menus, tracks, and other features, iDVD keeps track of the disc space that will be used. It counts not only the video used in your movie tracks but also space needed by menus, images, and audio used in your project. Motion menus take up much more disc space than still menus.

If you are interested in authoring DVDs with more encoding flexibility and more customization options, consider Apple's professional authoring solution, DVD Studio Pro (http://www.apple.com/dvdstudiopro).

Important: This software may be used to reproduce materials. It is licensed to you only for reproduction of non-copyrighted materials, materials in which you own the copyright, or materials you are authorized or legally permitted to reproduce. If you are uncertain about your right to copy any material you should contact your legal advisor.

Soundtrack: Quits Unexpectedly on Power Mac G5

Soundtrack may quit unexpectedly when certain actions are performed after opening the Preferences pane.

Products Affected

Final Cut Pro, Soundtrack Pro

This article has been archived and is no longer updated by Apple.

Symptom

Soundtrack unexpectedly quits.

This happens if you do one of these actions after opening the Preferences pane:

- Create a new document.
- Open a previously saved document.
- Click the Record Transport button.

Note: This issue only occurs on the Power Mac G5. "Mac OS X 10.2.7 (G5)" is available only with Power Mac G5 computers and cannot be installed on other computers.

Solution

Update to Soundtrack 1.1. The update can be obtained via the Software Update pane in System Preferences.

Archived - iMovie: Unable to Play or Import Clips on Power Mac G4 Cube

iMovie cannot play or import clips from a DV camera if there aren't any speakers connected to your Power Mac G4 Cube computer.

Products Affected

iMovie

This article has been archived and is no longer updated by Apple.
Symptom

You can't play or import clips from a DV camera or other device.

Solution

1. Quit iMovie if it is open.
2. Make sure the speakers that came with your computer, or other USB speakers, are connected to the computer.
3. Open iMovie and try importing again.

If you are still unable to play or import clips, check the following:

- Make sure your computer's firmware is up-to-date. See technical document 75129, "**Power Mac G4 Cube Firmware Update 4.1.9 :Information and Software**".
- Make sure the DV camera or other device can be used with iMovie 3. A list of cameras that work with iMovie is available from the iMovie website (http://www.apple.com/imovie/compatibility/camcorder.html).

DVD Studio Pro 2: Late-Breaking News

- **Last Modified:** April 11, 2004
- **Article:** TA27497

- **Old Article:** 93343

Learn about important late-breaking information for DVD Studio Pro 2.

Products Affected

DVD Studio Pro

For the latest information about product updates, tips and techniques, and qualified third-party devices, visit the DVD Studio Pro website at http://www.apple.com/dvdstudiopro/.

General Information

Missing Fonts Automatically Replaced
If you open a DVD Studio Pro project that uses a font that is not on the computer you are opening it on (either because the font was deleted or the project was created on a different computer), any items using the missing font have a different font substituted with no warning.

There are three items in a DVD Studio Pro project that utilize fonts: a menu's text objects, a button's text, and text-based subtitles.

Using FireWire Drives
For best results, make sure that the external FireWire drive you are using is connected to your computer and turned on before you open DVD Studio Pro. While writing data, do not disconnect your FireWire drive from your computer. This will disrupt the process and result in a write failure.

Getting Consistent Colors With Still Assets
The colors in the still assets you use in your project are affected by the Display Profile you choose in your computer's System Preferences (in the Displays pane in the Color tab). To make sure the colors in the still assets more closely match the color profile applied to the video assets, and match other computers running DVD Studio Pro, choose the Generic RGB Profile in the Color tab, and set the Colors to Millions in the Display tab.

Asset Information

Deleting the MPEG Folder While Encoding Can Cause Problems Later

If, while DVD Studio Pro is encoding an asset, you delete the MPEG folder that it creates to hold the asset, DVD Studio Pro may stop responding when you later build your project.

Video and Audio Lengths of a QuickTime Asset May Appear to Be Different
When you import a QuickTime asset that contains both video and audio, you may find that their lengths, as shown in the Assets tab, do not match exactly. This is often due to the DVD-Video specification's frame rate for the supported audio formats not dividing evenly into the video frame rate. This does not affect the lip sync between the audio and video streams or their playback, and is purely cosmetic.

Using AAC Audio Files From the Apple iTunes Store
DVD Studio Pro is able to import and use AAC format audio files purchased from the Apple iTunes Store as long as the computer you are using them on is authorized to use them. If you import iTunes Store files that the computer is not authorized to use, DVD Studio Pro will play silence when it encounters those files. Additionally, if you select and try to play a iTunes Store file that the computer is not authorized to play in the Audio tab of the Palette, DVD Studio Pro will play silence.

Projects With Missing Parse Files Must Reparse While Opening
When you open a project that uses assets requiring parse files, DVD Studio Pro checks to see if the files are available. If not, it creates them as part of the project-opening process; in these cases, the project takes longer to open. It is not uncommon for the parse files to be left behind when moving a project and its assets from one computer to another. Creating the parse files can take from a few seconds to several minutes, depending on the number and length of the assets used in the project. A progress bar indicates the completion status of the parse file.

720 x 486 NTSC Still Assets Are Scaled
If you import 720 x 486 still assets, commonly referred to as CCIR NTSC or D-1, DVD Studio Pro scales them vertically to a height of 430 lines. You can work around this issue by either scaling or cropping the assets to 720 x 480 with a graphics program.

Missing Assets Do Not Automatically Relink While the Project Is Open
If your project has missing assets, their names and the names of any elements that use them appear in red in the Assets and Outline tabs. If you correct the reason that the assets are missing-for example, you connect the FireWire drive that contains them to your system- their names in the Assets tab turn black, indicating they are now available to be relinked. You must either use the Relink window or close and reopen the project to relink the assets.

Mask Edges May Be Visible in Shapes You Create
If you make the thumbnail image mask layer (the first layer) of a shape the same size as the shape's graphics layer (the second layer), you may see some of the mask layer around the edges of the graphics layer. This is because the shape's graphics layer is processed differently than the mask layer. You can work around this issue by making the mask layer slightly smaller than the graphics layer. Note: The thumbnail image mask layer is only required if you intend to show an asset in the shape. If you do not intend to show an asset in the shape, you can leave this layer empty (but the layer must still be there).

Using Shape Layers for Drop Shadows
When you activate drop shadows on a button or drop zone using a shape, DVD Studio Pro uses the first two layers of the shape's PSD file to define the shape of the drop shadow. These are the layers that define the image thumbnail area and the shape's visible graphic.

Single Layer Shape Files Are Not Supported
All shape files you import must have at least two layers. If you import a shape file that has a single layer, a gap appears in the Palette where the shape should appear. You cannot select the shape or delete it within DVD Studio Pro.

To delete a single layer shape file, do one of the following:

- If the shape was not imported as a project-only shape, use a Finder window to locate the shape's file in the [root]/Library/Application Support/DVD Studio Pro/Shapes folder and delete it.
- If the shape was imported as a project-only shape, you only have to delete the original shape file from its original location. (When a shape is imported as a project-only shape, a reference is added to the project, defining the shape's location.)

16-Bit RGB and All CMYK PSD File Formats Are Not Supported
DVD Studio Pro does not support 16-bit RGB or any CMYK format PSD files. Since Adobe Illustrator files are imported into Photoshop as 16-bit CMYK files, you need to change their mode in Photoshop to 8-bit RGB before saving them as a PSD file for importing into DVD Studio Pro.

Markers in MPEG Files Encoded With DVD Studio Pro 2 Do Not Appear in Earlier Versions of DVD Studio Pro
The markers in MPEG files encoded with DVD Studio Pro 2 are not compatible with earlier versions of DVD Studio Pro. You need to manually add the markers to the files if you want to import them into the earlier version of DVD Studio Pro.

Reference QuickTime Movies With Missing Assets That You Cannot Locate Must Be Cancelled Multiple Times
If you import a reference QuickTime movie (that relies on a master movie for its content), and you cannot locate its master movie, you must cancel the QuickTime search three times before the search is terminated, and DVD Studio Pro displays an asset import error dialog.

Segmented MPEG Files Do Not Import Correctly
The segmented MPEG files created by some third-party encoders do not import correctly into DVD Studio Pro. Some encoders segment their large encoded files into 1 GB files. When imported into DVD Studio Pro, only the first 1 GB segment is imported. You need to append the files into a single file before importing the asset into DVD Studio Pro. There are several third-party applications that can be used to append a segmented MPEG file into a single file.

Existing Clips in Tracks Automatically Use the Reencoded Version of an Asset
If you reencode an asset that has already been assigned as a clip to a track, the track automatically uses the newly encoded version. If you change the bit rate before reencoding, the original bit rate-encoded version of the asset is still available, and can be reused.

Viewer Information

Some Assets Show Field-Based Artifacts
Some assets, most commonly 16:9 PAL assets, show field-based artifacts when playing in the Viewer tab. You can improve their playback by choosing Show Single Field from the Viewer tab's Settings pop-up menu.

Display Condition Information

Last Chapter Played Setting Reliable When Assigned to Menus
When using the Last Chapter Played setting for display conditions assigned to a track or story, you will get unreliable playback on some DVD players. The Last Chapter Played setting can be used reliably with display conditions assigned to menus.

Display Conditions Using the Subtitle Stream Number Only Work With the Subtitle Stream Set to View
When you configure a display condition for a track or story that uses the subtitle stream number option, the display condition will work correctly only if the subtitle stream is set to be viewed. For example, if you configure a menu's button to use subtitle stream S1 and a track has a display condition configured for subtitle stream S1, the display condition will only work correctly if you also select the subtitle stream's View checkbox in the Button Inspector.

Some DVD Players Do Not Allow Parental Level in Display Conditions
Some DVD players do not process the parental level option correctly when used in a display condition, allowing content to play that should be disallowed.

Menu Information

Text Justification Can Be Overridden If Set With Keyboard Shortcuts
If you use keyboard shortcuts to set the justification of text in text objects or buttons, the text justification will be overridden if you change the text later. For example, if you create a text object on a menu, type two lines of text, press Shift-Command-], and deselect the text object, the two lines of text will right-justify. If you then select a word in one of the lines and change its color, font, or spelling, the text jumps back to its original justification (as controlled by the Text Object Inspector). You can work around this issue by using the justification controls in the Text Object or Button Inspector to set the text justification.

Not All Shapes Support Button Highlights
Not all of the shapes supplied with DVD Studio Pro support highlights. Some shapes are intended to be used with drop zones, and do not include the highlight layer used by buttons.

Item Descriptions for Menus Do Not Retain Their Languages
If you create a menu that supports multiple languages and export an item description for it, the item description will not contain any language attributes. For example, if you configure a menu to support three languages, with each language having different backgrounds and text objects, and export the menu as an item description, the item description will only retain the background for the first language and any buttons that have been configured. All text will be deleted (although the text objects will remain).

Applying Different Templates to Different Languages on the Same Menu Is Not Supported
When working with a menu that supports multiple languages, you can get inconsistent results if you apply different templates to each of the languages within that menu. Since each language version of a menu must have the same number of buttons, drop zones, and text objects, and they must be in the same locations, applying a template that configures these items forces all other language versions in that menu to conform to this template's layout. It is recommended that you apply a template to the first language and then manually modify the other languages as necessary.

Last Letter in Italicized Text May Be Partially Clipped
When you add italicized text to a text object or button in the Menu Editor, it is possible that the last character may be partially clipped. Whether or not this happens depends on what the last letter is and the font you are using. You can work around this issue by adding one or more spaces to the end of the text.

Overly Large Font Size Can Make a Text Object Disappear
If you set the font size so large that the text does not fit vertically on the screen, the text object disappears. As long as you still have the text in the text object selected, you can enter a smaller font size and the text will reappear. If it is not selected, you can choose Edit>Select All to select it (and all other items on the menu) and enter a smaller font size. (If there are other text objects, this change will also affect their font size.)

Button Assets Do Not Automatically Update
If a button's asset is automatically set after a Drop Palette action, such as dragging a track to a button in the Menu Editor, the button's asset does not automatically update if you later change the asset used by that track. You must manually choose the button's asset if you want it to match the new one used in the track.

Changing the Simple Highlight Color in Apple Templates Can Create Bad Edges
The Apple templates use the same highlight color for all four of the color mapping settings for the template's buttons. Since the template reduces the opacity for the dark gray and light gray color mapping settings, the buttons have pseudo anti-aliased edges. The Apple templates are also set to the simple overlay mode.

When you change a highlight color in the simple overlay mode, you only change one of the four color mapping settings (the black one), which can lead to a situation where the primary highlight color has been changed while the other highlight colors, generally only seen on the button's edges, retain the original color. For example, if the template uses a red highlight color and you use the simple overlay mode to change the color to blue, the button's new blue highlight color will have red edges.

To avoid having different highlight colors appear on the button edges when modifying the Apple templates, select the Advanced overlay mode in the Color Settings tab in the Menu Inspector, and set all four of the color mapping colors to the same color.

Premastering Information

CMF Format DVDs Cannot Be Burned on Systems With an Adaptec SCSI Card
DVD Studio Pro is unable to burn CMF format DVDs on an authoring DVD-R drive connected to your system using an Adaptec SCSI card. Systems with an Adaptec SCSI card are able to burn non-CMF and DDP discs as well as write any of the supported formats to a DLT drive. Systems with Apple-approved ATTO SCSI cards are able to burn CMF format DVDs on an authoring drive.

Region Code Information

Unreliable With General Media Discs
If you change the region code settings and burn a DVD using general media, some DVD players that should be prevented from playing it will play the disc. This issue does not occur with replicated discs originated from either general or authoring media.

Video Bit Rates That Are Too High Are Allowed When Using Multiple Streams
DVD Studio Pro allows video clips with bit rates that exceed the maximum allowable bit rate to be used when creating a project with multi-angle or mixed-angle tracks. When creating multi-angle or mixed-angle tracks, the maximum allowable video bit rate for clips in a track is reduced, depending on how many additional video streams you add. If the bit rate is left too high, some DVD players may have trouble playing the DVD smoothly. See the DVD Studio Pro 2 User's Manual for more information.

Project Import From iDVD and Earlier Versions of DVD Studio Pro Information

Slideshows Created in iDVD Drop Zones Only Display the First Slide
If you import an iDVD project that contains a drop zone configured as a slideshow and has multiple slides assigned to it, DVD Studio Pro will only show the slideshow's first slide in the drop zone.

Default Highlighted Button Can Change in iDVD Menus
When you import an iDVD project, you may find that the button that is highlighted by default on some menus may change. During the project import, DVD Studio Pro numbers the buttons on each menu and highlights button 1 by default. You can assign any button on a menu to be the default button in the Menu tab in the Menu Inspector.

Script Information

GPRM-Based Jump Command Only Allows Selection of Specific Parts of an Element
When configuring a GPRM-based jump command in a script, you should not be able to choose specific parts of an element with the Jump To pop-up menu. For example, you should be able to choose menu 1, but not button 3 of menu 1. (The selected GPRM is intended to choose the specific button in this case.) If you choose a specific part of an element from the Jump To pop-up menu with the GPRM Based checkbox selected, only the element is used and the specific part you chose is replaced by the value supplied by the selected GPRM.

Simulator Information

Simulator Displays Subtitles That Cross Chapter Markers
Subtitles cannot appear across chapter markers, and DVD Studio Pro automatically trims the subtitles accordingly during the build process. However, if you simulate a track that has a subtitle that extends across a chapter marker, the subtitle will continue to appear. Be sure to build your project and test the subtitles using a DVD player so that you are not surprised by a subtitle that gets trimmed unexpectedly.

Simulator Changes Subtitle Streams Incorrectly
In the Simulator, if you change subtitle streams while playing a track, the current subtitle from the new subtitle stream appears immediately, even if

it is in the middle of the subtitle text. The proper behavior, as happens with DVD players, is for the DVD not to change subtitle streams until the current subtitle clip ends, and not to show a subtitle from the new stream until a new subtitle clip starts on that stream.

Slideshow Information

Minimum Slide Duration
Each slide in a slideshow must have a duration of at least 12 frames if you are using the NTSC video standard, or 10 frames if you are using the PAL video standard. You are not warned of this requirement until you build your project. The most common way to encounter this problem is to use a very short overall audio file and select the "Fit to audio" setting in the Slideshow Editor.

Subtitle Information

Characters on a Right-Justified Subtitle May Be Cropped on the Right Edge
If you create a subtitle and set the text to be right-justified, the character on the right edge may get partially cropped. This issue does not exist with the left- and center-justified settings. If you require right-justified subtitles, you can use the left or center settings and manually position the subtitle along the right edge.

Stream Selection on Buttons Over Video
When configuring a button that is part of a buttons over video subtitle clip, you are not able to set the stream selections unless the button's target is set to "not set" or to a marker within that subtitle's track. If you need the button to jump to a specific stream on a different track, you can create a script that jumps as needed, and have the button jump to that script.

Track Editor Information

Zooming the Timeline to Fit the Selected Clip
You can zoom the timeline to fit the selected clip by pressing Shift-Option-Z. (The manual has the incorrect keyboard shortcut listed.)

Adding Chapter Markers Between Still Images and Video Clips in Tracks
To ensure proper builds, insert a chapter marker between each still and motion video clip within a track.

A.Pack Information

Having Too Many Jobs in an A.Pack Batch List Causes an Error Dialog
When you configure a large batch list, you may get an error dialog stating that there are too many files open. The number of jobs you can have in a batch list depends on their audio coding mode (two channel or 5.1 channel, for example) and the other applications that are open on your computer. In some cases, the error dialog may not appear until you start encoding the batch list. You can work around this issue by encoding your audio in smaller batch lists.

File Suffixes to Indicate the Channel Are Interpreted as the File Creator
Suffixes, such as .L for left front and .C for center front, are needed by A.Pack to differentiate the channels when using the drag-and-drop method to assign the files in A.Pack. In Mac OS X, the suffixes are interpreted as information about the file creator. As a result, the files that make up the different channels can be associated with various Mac OS X applications based on the suffix. This has no effect on the decoding of the files.

Compressor Information

In addition to the following topics, see the Late-Breaking News file in the Compressor documentation folder.

Encoding for Quicker Import Into DVD Studio Pro
When using Compressor to encode your video assets for use in DVD Studio Pro 2, you can speed up the importing process by selecting the "Add DVD Studio Pro meta-data" checkbox in the Compressor Extras pane in the Encoder pane (in the Presets window) before encoding them. This sets the Compressor encoder to include the parsing information in the encoded file, which makes the file usable as soon as you import it into DVD Studio Pro. **Note**: Selecting this checkbox makes the encoded file incompatible with earlier versions of DVD Studio Pro.

Using Markers Automatically Generated by Final Cut Pro
You can set the preset you are using in Compressor to either use or ignore the compression markers that Final Cut Pro adds to transitions when exporting a movie. In addition to any markers you manually set in Final Cut Pro, compression markers are added to its exported file at each transition. These markers can be used by Compressor to force I-frames at places that can greatly benefit from them (since transitions generally indicate a sudden change of video content) and result in a better encoded file.

The drawback is that the I-frames inserted at these automatic markers make it difficult to use the encoded file as part of a multi-angle or mixed-angle track.

Select the "Include chapter markers only" checkbox in the Compressor Extras pane in the Encoder pane (in the Presets window) to set Compressor to only process the markers (chapter and compression) you manually add in Final Cut Pro. Deselect this setting to allow Compressor to process both the markers you manually add and the markers Final Cut Pro automatically adds.

DVD Studio Pro only processes the markers you manually add in Final Cut Pro.

DVD@CCESS Information

DVD@CCESS Web Link Utility May Not Start Automatically on All Windows XP Computers
The Windows-based DVD@CCESS web link utility may not start automatically on all Windows XP computers if the computer is restarted. In a few cases, an error dialog appears, saying that Windows could not locate the necessary files. You are able to manually start the DVD@CCESS web link utility by double-clicking the DVDAccess.exe file, located in the /Program Files/Apple Computer/DVD@ccess folder.

DVD@CCESS Does Not Work Automatically With Plug-in Drives on Some Windows Computers
Web links on DVDs located in plug-in drives, such as FireWire and USB drives, work on Windows 2000 and Windows XP computers, but do not work on Windows 98, Windows SE, or Windows ME computers, until you relaunch or deactivate/reactivate DVD@CCESS.

Web Links May Open in the Same or New Windows
If you're using Netscape Navigator 6.x as your default web browser in Windows or the Mac OS, or Safari in the Mac OS, each time you activate a DVD@CCESS web link, it opens in a new browser window. With Internet Explorer and older versions of Netscape Navigator, DVD@CCESS links open in the same browser window.

DVD@CCESS Does Not Work With WinDVD 2.x DVD Players on Some Windows Computers
WinDVD 2.x versions (2.1 and 2.2) don't work with DVD@CCESS links on Windows 2000, Windows XP, or Windows NT computers.

Using CoolDVD With DVD@CCESS Links
A specific web link can only be activated once using CoolDVD 1.1 on Windows 2000 and Windows XP computers. Currently this problem does not exist in the latest version of CoolDVD.

DVD@CCESS Actions Assigned to Still Menus Play Erratically on Some Windows Players
DVD@CCESS actions assigned to still menus can play erratically on some Windows XP computers using the Media Player and on most Windows computers using Power DVD. In some cases, a DVD@CCESS action assigned to a different menu may be activated, or the action may be activated only the first time a menu is accessed. To work around this issue, you can create all menus with DVD@CCESS actions as motion menus.

Filenames Not Conforming to the 8.3 Filenaming Convention May Not Work With Some Windows Computers
Links that access files on the DVD disc itself (for example, file:///NameofDVD/xxx.xxx) and that contain names exceeding the 8.3 filenaming convention, may not be accessible on Windows NT 4 computers.

Copying a .VOB File Causes DVD@CCESS Links to Activate
Copying a .VOB file from a DVD (to a hard disk, for example) causes your default web browser to open and connect to all the URLs embedded in the DVD title. This happens because DVD@CCESS runs and reads all data from the DVD.

DVD@CCESS Links May Affect Playback When Activating
When DVD@CCESS opens a URL in a web browser, the level of performance and smoothness of video playback depend on your computer. The playback of video on a slower computer may be slightly interrupted when DVD@CCESS opens a URL.

iTunes: How to Use the "Copy to Play Order" Command

Learn how to use the "Copy to Play Order" command with a shuffled playlist.
This article has been archived and is no longer updated by Apple.
If you like the way iTunes has shuffled the play order of one of your play lists, you can use the "Copy to Play Order" shortcut menu command to make the shuffled play order the permanent play order.

To use this command, Control-click one of the songs in the playlist, and choose "Copy to Play Order" from the shortcut menu. **Tip**: These steps also apply to a playlist you have reordered directly (by clicking on one of the column headers like Artist or Album).

Important: This command will only appear if a playlist has been shuffled or reordered.

Figure 1 "Copy to Play Order" in the shortcut menu

iTunes for Windows: "You must purchase a new QuickTime Pro key to regain QuickTime Pro functionality" Message

- **Last Modified:** May 16, 2007
- **Article:** TA27501

- **Old Article:** 93351

A new QuickTime Pro key will be required if you're installing over QuickTime Pro.

Products Affected

QuickTime, iTunes

Symptom

When you install QuickTime or iTunes for Windows, these messages appear:

> "An older version of QuickTime Pro was detected on this machine. If you proceed with this installation you must purchase a new QuickTime Pro key to regain QuickTime Pro functionality." (Figure 1)

Figure 1 Warning message

> "Are you sure you want to proceed with the installation of QuickTime?" (Figure 2)

Figure 2 Confirmation of installation

Solution

Take advantage of all the great features of QuickTime Pro and buy an upgrade from the QuickTime website, or the Apple Store. You can continue the installation without purchasing a QuickTime Pro key, but you will no longer have access to the QuickTime Pro features.

Note: If you cancel the installation, you will not be able to use iTunes, the iTunes Store, or any of the other features of QuickTime, including MPEG-4 video and AAC audio.

iTunes for Windows: Installing Additional Plug-ins

In addition to the iTunes Visualizer, you can install and use non-Apple Visualizer plug-ins.

Products Affected

Windows OS, Windows Vista, Windows XP, iTunes

This article has been archived and is no longer updated by Apple.
iTunes Visualizer gives you a full-color creative light show with the click of a button. You can also install your own visual effects plug-ins to use with iTunes. **Note:** Plug-ins are for either the Mac OS X or Windows version of iTunes. Be sure to use the Windows plug-ins for the Windows version of iTunes.

To install a plug-in in Windows Vista:

1. Open /Users/username/AppData/Roaming/Apple Computer.
2. Open the iTunes folder.
3. Drag the plug-in to the iTunes Plug-ins folder. Note: You may need to create an iTunes Plug-ins folder here if no previous system-wide plug-ins have been installed. To create a new folder, on the File menu, click New Folder. Rename the folder "iTunes Plug-ins" without the quotes.

To install a plug-in in Windows XP and 2000:

1. Open the My Documents folder (Click Start, and point to My Documents).
2. Open the My Music folder.
3. Open the iTunes folder.
4. Drag the plug-in to the iTunes Plug-ins folder. **Note:** You may need to create an iTunes Plug-ins folder here if no previous system-wide plug-ins have been installed. To create a new folder, on the File menu, click New Folder. Rename the folder "iTunes Plug-ins" without the quotes.

iTunes for Windows: How to tell if you have a drive that can burn a CD

Learn how to tell if your computer has a drive that can burn a CD.

This article has been archived and is no longer updated by Apple.

To determine if the drive of your Windows Vista PC can burn a CD, click here.

Learn how to tell if your Windows XP PC has a drive that can burn a CD.

If you are not sure if your computer's CD or DVD drive can make or "burn" a CD-R disc, there are a few ways to find out.

You can also check the properties of the drive in Windows Explorer:

1. Open the My Computer window (Click the **Start** button, then point to **My Computer**.
2. Under Devices with Removable Storage, locate your CD or DVD drive.
3. Right-click on your drive and choose Properties from the shortcut menu (or left-click once to select the drive and from the File menu, choose Properties).

If there is a Recording tab in the Properties window that appears, your computer's drive can burn a CD. See Figure 1. Tip: The "Enable CD recording on this drive" option does not need to be checked for iTunes to burn a disc. This options affects Desktop CD recording only.

If there is no Recording tab in the Properties window that appears, your computer's drive cannot burn a CD. See Figure 2.

Typically, you can upgrade the CD drive in your computer to one that can burn discs. Contact the manufacturer or a computer reseller for more information.

QuickTime Streaming Server and Darwin Streaming Server: iTunes Store Files Cannot Be Added to a Playlist

- **Last Modified:** July 13, 2007
- **Article:** TA27505

- **Old Article:** 93370

iTunes Store files are protected and may not be streamed in QuickTime Streaming Server or Darwin Streaming Server.

Products Affected

iTunes Store, QuickTime

Symptom

When selecting files to add to a playlist, protected AAC files purchased from the iTunes Store do not appear in the list.

Solution

Use one of these formats for QuickTime Streaming Server or Darwin Streaming Server:

- Streaming MP3 files in music playlists
- Unprotected AAC files in movie playlists (the movie must have a hint track).

Additional information

Protected AAC files have the filename extension ".m4p". Unprotected AAC files from iTunes have the filename extension ".m4a".

See technical document 42644, "**QuickTime Pro: How to Prepare a Movie for Streaming**" for information on how add a hint track to an unprotected AAC file using QuickTime Pro. You can also use QuickTime Streaming Server Publisher, new in QuickTime Streaming Server 5, to automatically add a hint track to an unprotected AAC file. See the **QuickTime Streaming Server** webpage for additional information.

Audio MIDI Setup: MIDI Configurations Are Lost

- **Last Modified:** October 04, 2008
- **Article:** TA27506

- **Old Article:** 93372

Some non-Apple drivers may not store the previously saved configuration for all devices.

Products Affected

Mac OS X 10.0, Mac OS X 10.3

Symptom

MIDI settings you previously made are lost when you reopen Audio MIDI Setup.

Solution

Audio MIDI Setup queries the drivers for all connected audio devices in order to determine the previously saved configuration. Some non-Apple (third-party) drivers may not store the previously saved configuration for all devices. Contact the vendor of your audio device for an updated driver.

Final Cut Pro 4: Some TrueType Fonts Don't Appear

- **Last Modified:** October 04, 2008
- **Article:** TA27508

- **Old Article:** 93375

Some TrueType fonts may not appear in the Final Cut Pro 4 text generators.

Products Affected

Final Cut Pro

Symptom

Some installed TrueType fonts are not listed.

This occurs with the following text generators:

- Crawl
- Lower 3rd
- Outline Text
- Scrolling Text
- Text
- Typewriter

Solution

Update to Final Cut Pro 4.1. The update can be obtained via the Software Update pane in System Preferences.

iSight: About Speech Recognition

- **Last Modified:** January 08, 2004
- **Article:** TA27509

- **Old Article:** 93378

iSight's built-in microphone works great for iChat AV or any application that can record sound, but it cannot be used for speech recognition.

Products Affected

iSight

Symptom

iSight does not work with the Apple Speakable Items speech recognition system.

Solution

You can use iSight with Apple Speakable Items in Mac OS X 10.3 or later.

To take advantage of Apple Speakable Items in Mac OS 10.2:

1. Use the computer's built-in microphone, or connect a compatible USB or line-in microphone.
2. From the **Apple** menu, choose **System Preferences.**
3. From the **View** menu, choose **Speech.**
4. Click the Listening tab.
5. Choose your microphone from the Microphone pop-up menu.

Final Cut Pro 4: How to delete the preference files

- **Last Modified:** June 07, 2004
- **Article:** TA27510

- **Old Article:** 93385

Learn how to resolve issues caused by unusable preference files in Final Cut Pro 4.

Products Affected

Final Cut Pro

When troubleshooting Final Cut Pro, one step you can take is to delete the Final Cut Pro preference files. Doing this restores Final Cut Pro to the default settings and behavior. These files contains user preferences for scratch disk settings, capture settings, window layouts, and so forth.

To delete the Final Cut Pro 4 preferences files, do the following:

1. Quit Final Cut Pro 4.
2. Click the Finder icon in the Dock.
3. From the **Go** menu, choose **Go to Folder**.
4. Type: `~/Library/Preferences/` **Note**: The tilde "~" refers to your home directory. For more information see "Mac OS X: Using Your Home Directory".
5. Click Go.
6. Drag the file named "com.apple.FinalCutPro.plist" to the Trash (Figure 1).
7. Double-click the folder named "Final Cut Pro User Data".
8. Drag the file named "Final Cut Pro 4.0 Preferences" to the Trash (see Figure 2).
9. Drag the file named "Final Cut Pro POA Cache" to the Trash (Figure 2).
10. Open Final Cut Pro.

Important: Do not delete any of the other files in the Final Cut Pro User Data folder.

Figure 1 The Final Cut Pro plist file

Figure 2 Final Cut Pro 4.0 Preferences and Final Cut Pro POA Cache files

Once this process is completed Final Cut Pro reverts to its installed defaults. Reset all of your desired application preferences to match what they were before--in particular your Scratch Disk Preferences, keyboard mappings, and the selected Sequence Settings.

Back up configured preference files

To avoid recreating all your custom settings in the event you have to delete the preference files again, follow these steps to save a clean copy of the file:

1. Make a backup copy of the "Final Cut Pro Preferences" and the "com.apple.FinalCutPro.plist" files immediately after it is configured for the first time.
2. Put the backup copy of the files in a safe place.

If you have to delete the preference files again, you can simply replace them with the backup copy of the saved, clean files. This preserves your desired preference settings, while eliminating any unwanted behaviors that may have been caused by a faulty Final Cut Pro Preferences file.

Note: It is not necessary to back up the Final Cut Pro POA Cache file.

iTunes for Windows: How to make iTunes the default application for music and audio files

- **Last Modified:** February 02, 2006
- **Article:** TA27514

- **Old Article:** 93397

Learn how to make iTunes the default application for many Internet music and audio formats.

Products Affected

iTunes

iTunes can play many types of audio files available on the Internet. Using Windows, you can select iTunes as the default application to open audio files.

For a complete list of the kinds of audio files iTunes can play, see, "iTunes: Compatible Audio File Types".

There are two ways that iTunes for Windows can be configured as the default application. The preferred way is to configure using iTunes preferences. The other is to use the Set Program Access and Defaults program.

Changing the default media application

Using iTunes

1. Open iTunes.
2. From the **Edit** menu, choose **Preferences**.
3. Click the Advanced button and then click the General tab.
4. Click "Use iTunes as the default player for all audio files" to select this option.

Note: Deselecting this option tells Windows to use the default application you used before iTunes.

Using Set Program Access and Defaults application

1. Click the **Start** button, point to **All Programs**, then click **Set Program Access and Defaults**

   The Set Program Access and Defaults window appears.

2. Click the arrow to the right of Custom.

3. Under the "Choose a default media player:" heading, click iTunes.

4. Click **OK**.

Note: To make a different application the default media player, follow these same steps and select the application you want to use.

iTunes for Windows: Songs Play Faster Than Normal on Some Dell Computers

- **Last Modified:** October 04, 2008
- **Article:** TA27515

- **Old Article:** 93402

You may need to update your Dell computer's sound card drivers so iTunes can play songs at the right speed.

Products Affected

iTunes

Symptom

Songs play at a faster than normal speed. This includes songs played from audio CDs as well as songs in your iTunes library.

Solution

Contact Dell for updated sound card drivers. With the updated drivers, songs play at their normal speed.

iTunes for Windows: Shared Music Library Doesn't Load

- **Last Modified:** December 09, 2003
- **Article:** TA27516

- **Old Article:** 93404

You may not be able to listen to shared music if your computer is using more than one network connection at the same time.

Products Affected

iTunes

Symptom

When you click a shared music library in the Source list, the status area at the top of the iTunes window says the library is loading, but its contents never appear.

This happens if your computer is using more than one network connection at the same time. For example, you may be using both an Ethernet and wireless network connection.

Solution

Turn off one of your active network connections.

1. Click the **Start** button, then point to **Control Panel**.
2. Click Network and Internet Connections.
3. Click Network Connections.
4. Right-click the network interface you want to disable.
5. Choose **Disable** from the shortcut menu that appears.
6. Click the **Start** button, then point to **Turn Off Computer**.
7. Click Restart.

Note: If you need to use the network interface that was disabled, follow these steps again, but in Step 5 choose Enable instead of Disable.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information. See Document 17159, "**Locating Vendor Information**" can help you search for a particular vendor's address and phone number.

QuickTime 6.4: How to get the updated MPEG-2 Playback Component

- **Last Modified:** May 14, 2004
- **Article:** TA27517

- **Old Article:** 93407

An updated version of the MPEG-2 Playback Component is required for use with QuickTime 6.4 on Mac OS X.

Products Affected

DVD Studio Pro, Final Cut Pro

If you purchased the MPEG-2 Playback Component from the Apple Store online or received it with Final Cut Pro 4 or DVD Studio Pro 2, you are eligible to receive an updated version for free. Based upon how you received your copy of the MPEG-2 Playback Component, please follow the appropriate directions below to receive the updated software.

Apple Store
If you purchased your MPEG-2 Playback Component from the Apple Store, follow these instructions to download the update:

1. Connect to the Apple Store (http://www.apple.com/store/). If you are not in the United States, choose your country's Apple Store from the menu at the bottom of the page.
2. Click "Your Account" in the store menu bar at the top right of the page.
3. Enter your Apple ID and password.
4. Click "Software Download Purchases". You will see a link to the QuickTime 6 MPEG-2 Playback Component.
5. Click the link to download and install the updated version.

Final Cut Pro 4 and DVD Studio Pro 2
If you received your MPEG-2 Playback Component as part of Final Cut Pro 4 or DVD Studio Pro 2, an update is available via Software Update in System Preferences.

Note: This update works with both QuickTime 6.3 and QuickTime 6.4.

Archived - Keynote 1.1.1: Read Before You Install

Keynote 1.1.1 is an update for computers with Mac OS X 10.2.8 or Mac OS X 10.3 or later.

Products Affected

Keynote, Mac OS X 10.3

This article has been archived and is no longer updated by Apple.

Requirements

- Keynote 1.0 or 1.1
- Power Mac G3, G4 or G5, PowerBook G4, eMac, iMac or iBook with 500 MHz or faster processor (Power PC G4 recommended)
- Mac OS X 10.2.8 or later (Mac OS X 10.3 Panther recommended)
- 128 MB of RAM (512 MB recommended)
- 8 MB of video memory (32 MB recommended)
- 1 GB of available disk space
- QuickTime 6.3 or later is recommended

Where to download

If your system meets the requirements above, Keynote 1.1.1 is available via the Software Update pane in System Preferences.

What's new in Keynote 1.1.1

If you are using Keynote on a computer with Mac OS X 10.2.8 or later installed, you must install the Keynote 1.1.1 update. The update delivers enhanced features and improved reliability of the Keynote application.

Installing Keynote

Keynote must be installed on your startup volume (the partition of your hard disk that contains a System folder for Mac OS X version 10.2.8 or later). During installation, files related to the Keynote application are placed on your hard disk in the following locations:

A sample document is placed in the folder

> [hard disk]/Library/Application Support/Keynote/Samples.

Image Library documents are placed in the folder

> [hard disk]/Library/Application Support/Keynote/Image Library.

More information

For more information on Keynote, visit **http://www.apple.com/keynote/**. For a comprehensive guide to using Keynote, check out the "Keynote User's Guide."

Keynote also provides onscreen instructions. To access onscreen instructions, from the **Keynote Help** menu, choose **Help**. Click Contents to browse a list of topics or type your question in the Search field and press Return.

iPod (with Dock Connector): Battery Depleted After Pausing Voice Recording

- **Last Modified:** October 04, 2008
- **Article:** TA27526

- **Old Article:** 93442

If you press pause while recording audio, iPod's battery may be depleted if you don't subsequently stop recording.

Products Affected

iPod

Symptom

iPod's battery is depleted even though you haven't used iPod very much. The last thing you did was pause a voice recording.

Solution

Pausing voice recording can quickly deplete iPod's battery. Turn off voice recording when you've finished instead of pausing.

Do one of the following:

- Press Menu to exit the Voice Memo screen.
- Select Resume and then Pause again.

Either of these allows the hard drive to turn off or "spin down". Selecting Stop and Save also allows the hard drive to spin down.

This document will be updated as more information becomes available.

Keynote: How to Print Slides Containing Semi-Opaque Objects

- **Last Modified:** October 04, 2008
- **Article:** TA27527

- **Old Article:** 93450

Learn how to print Keynote slides that contain semi-opaque objects.

Products Affected

Keynote

When printing a presentation in Keynote, slides that contain semi-opaque objects will not print as they appear on the screen. Follow these steps to print Keynote slides that contain semi-opaque objects while preserving their transparency. **Note**: Using these steps will result in a lower quality printout than printing from Keynote directly. Use it only if preserving transparency of a slide is important.

Take a screen capture of the slide.

1. Open the Keynote presentation.
2. Select the slide from the Slides list.
3. Press Command-Shift-4 on your keyboard. The mouse cursor changes into an area selection tool.
4. Put the center of the area selection tool in one of the corners of the slide in Keynote.
5. Click and hold the mouse button.
6. Drag the area selection tool to the opposite corner of the slide.

Print the screen capture

1. Look for a new file on your desktop named "Picture x" where "x" is a number. **Note**: The number will be incremented by one every time you take another screen capture.
2. Double-click the file.
3. From the **File** menu, choose **Print**.

DVD Studio Pro 2: How to Uninstall

- **Last Modified:** May 06, 2004
- **Article:** TA27528

- **Old Article:** 93452

Learn how to uninstall DVD Studio Pro 2.

Products Affected

DVD Studio Pro

To uninstall DVD Studio Pro 2, drag each of its files to the Trash. All of the folders (directories) and files installed as part of DVD Studio Pro 2 are listed in the table below.

For easy access, use the Finder's Go to Folder command. From the **Go** menu, choose **Go to Folder**, enter the directory name, and click Go.

Directory Name	File Name
/Applications/	A.Pack.app
	Compressor.app (see note below)
	DVD Studio Pro.app
/Applications/Utilities/	Batch Monitor.app
/Library/Application Support/	DVD studio Pro (Folder)
/Library/Application Support/ProApps/	DVD Studio Pro System ID
/Library/Frameworks/	AECore.framework (see note below)
	Compressor.framework (see note below)
	MediaServerAPI.framework (see note below)
	Qmaster.framework (see note below)
/Library/Receipts/	APack.pkg
	Compressor.pkg (see note below)
	DSPExtras.pkg
	DVDStudioPro2.pkg
	DVDStudioPro202Update.pkg (if 2.0.2 updater was run)
	ProAppRuntime.pkg
	QTProMedia.pkg (see note below)
	QuickTimeMPEG2.pkg (see note below)
/Library/StartupItems/	Qmaster (see note below)
/private/etc/	qmaster (see note below)
/System/Library/QuickTime/	QTMPEGExport.component (see note below)
	QuickTimeMPEG2.component (see note below)
	QuickTimeProMedia.component (see note below)
/usr/sbin/	qmasterd (see note below)
	qmasterqd (see note below)
~/Library/Application Support/	DVD Studio Pro
~/Library/Preferences/	com.apple.dvdstudiopro.plist

Note: If you have installed Final Cut Pro 4, Shake 3, QuickTime Pro, or QuickTime MPEG Component, do not remove the files noted above.

You can't import or play music from an audio CD in iTunes for Windows

- **Last Modified:** May 31, 2007
- **Article:** TA27529

- **Old Article:** 93453

Learn troubleshooting steps to take if audio CDs or songs imported from audio CDs won't play.

Products Affected

iTunes

Try the steps below if iTunes for Windows recognizes an audio CD but won't play it, or doesn't play songs you import from an audio CD. In some cases iTunes appears to import songs from the audio CD, but the created tracks contain no music and have a time of 0:00.

1. Update iTunes

Download and install the latest version of iTunes for Windows.

2. Deslect "Use error connection when reading audio CDs"

1. Open iTunes.
2. From the **Edit** menu, choose **Preferences**.
3. Click the Advanced tab then click the Importing tab.
4. Deselect the option to "Use error correction when reading audio CDs" if it is selected.

5. Click OK.

3. Check for software updates

Microsoft or your computer's manufacturer may have released updated software. Check to see if there are updates to Windows or to the software that controls the drive. Check your computer manufacturer's website for updates, particularly for updates to the CD or DVD drive. If you bought the drive separately from the computer, check the drive manufacturer's website. In some cases, drivers for other devices (such as video and sound cards) could affect how the CD or DVD drive works. Make sure all video and sound card drivers are the most recent versions.

4. Check for firmware updates

From time to time manufacturers publish updates to a CD or DVD drive's internal software (known as firmware). Check your computer manufacturer's website for firmware updates first. This is important because the internal drives used by some companies (including Dell) require special firmware. If an update is not available from the computer manufacturer, check with the company that made the drive. In some cases, firmware for other devices (such as video and sound cards) could affect how the CD or DVD drive works. Make sure all video and sound cards have the latest firmware also.

Important: Use special care when installing firmware updates. Incorrectly installing a firmware update could damage the drive and make it unusable. Always check with the computer manufacturer first before checking with the drive manufacturer.

5. Try different drive

If you have more than one optical drive, try using iTunes with each drive.

If you are still unable to play or import from audio CDs after you try these steps, your optical drive may not work with iTunes.

6. Run CD Diagnostics in iTunes

Click here for more information.

This document will be updated as more information becomes available.

iMovie: Using FileVault Can Affect Performance

- **Last Modified:** November 12, 2003
- **Article:** TA27532

- **Old Article:** 93460

Learn how to use iMovie with FileVault, a feature of Mac OS X Panther.

Products Affected

iMovie, Mac OS X 10.3

FileVault is a feature of Mac OS X 10.3 that allows you to secure access to your home folder through the use of encryption. When FileVault is turned on, files in your home folder are encrypted and decrypted as needed.

Using iMovie when FileVault is turned on may reduce iMovie performance if the project is saved in the encrypted directory (usually your home folder).

For best results when using FileVault, move your iMovie project folder outside your home folder, such as /Users/Shared/, or to another hard disk.
Note: You must move the entire project folder out of your home folder.

After you have finished editing the project, you can drag its folder back into your home directory.

If you don't move your iMovie project folder out of your home directory, you may experience these issues:

- Recording a voiceover in iMovie results in the alert message, "The disk responded slowly."
- Video imported from a DV device has dropped frames, or iMovie unexpectedly stops importing video.

iPod (with Dock Connector): Operational Sounds May be Recorded by Microphone

- **Last Modified:** July 01, 2004
- **Article:** TA27539

- **Old Article:** 93472

When recording a voice memo with the Belkin iPod Voice Recorder, the normal sounds iPod makes when you use it may also be recorded.

Products Affected

iPod

The normal sounds iPod makes when you use it may be picked up by the microphone when you record a voice memo. This includes the sounds the hard disk makes, actions such as pressing buttons, engaging or disengaging the hold switch, or using the touchwheel. These sounds may be more noticeable when there is very little battery charge remaining.

QuickTime: Exporting AVI Files Larger Than 1 GB

- **Last Modified:** October 04, 2008
- **Article:** TA27544

- **Old Article:** 93490

Applications that use QuickTime may not be able to export AVI format movies that are greater than about 1 GB in size.

Products Affected

Final Cut Pro, QuickTime, Final Cut Express, Windows OS, iMovie

Symptom

After exporting an AVI file larger than 1 GB, the file size appears correct, but the movie stops playing when it reaches the 1 GB point.

Solution

QuickTime can open large AVI files, but does not export AVI files larger than about 1 GB. Export the file using the MPEG-4 or QuickTime Movie formats instead.

This document will be updated when additional information is available.

iMovie 5 and earlier: Importing Files Larger Than 2 GB

- **Last Modified:** May 25, 2007
- **Article:** TA27545

- **Old Article:** 93494

Products Affected

iMovie

iMovie (versions 1-5) can import files up to 2 GB in size.

Using the Import command in iMovie's File menu, you can import QuickTime or DV files that are up to 2 gigabytes (GB) in size. If you try to import larger files, iMovie may unexpectedly quit, or you may see a message that says the file is too big or an alert stating the "file could not be imported: (-40)".

With QuickTime Player Pro, you can split a large file into two or more smaller ones that iMovie can import. QuickTime Pro is available from the Apple Store.

See "QuickTime Pro: How to Edit Portions of a Movie" for steps on how to split a large file using QuickTime Pro.

iMovie: Fast User Switching and DV Camera Control

- **Last Modified:** February 03, 2005
- **Article:** TA27546

- **Old Article:** 93495

If Fast User Switching in Mac OS X 10.3 is enabled, make sure other users have logged out of their account if you can't use a camera connected to the computer.

Products Affected

Mac OS X 10.3, iMovie

If you can't control a DV camera connected to the computer, or if iMovie doesn't recognize it, other users may be logged in and accessing the camera in iChat, iMovie, or another video application. Make sure other users have logged out of their accounts.

Note: Switching users while importing footage may cause the import to stop.

Final Cut Pro 4.1: Timeline Copy and Paste Follows Auto Selected Tracks

Learn how copying and pasting clips has changed in Final Cut Pro 4.1.

Products Affected

Final Cut Pro

This article has been archived and is no longer updated by Apple.

In earlier versions of Final Cut Pro, clips pasted in the Timeline are placed in the currently selected*destination tracks*. In Final Cut Pro 4.1, clips pasted in the Timeline are placed according to track Auto Select controls.

When clips are pasted in the Final Cut Pro 4.0.2 Timeline, the following rules apply:

- The currently selected destination tracks determine where clips are pasted.

Linked video and audio clips are pasted in corresponding video and audio pairs: Video track V1 corresponds to audio tracks A1 and A2, video track V2 corresponds to audio tracks A3 and A4, and so on. For example, if you set track V2 as the video destination track, the linked audio clips are pasted automatically in tracks A3 and A4.

When clips are copied in the Final Cut Pro 4.1 Timeline, only clips on the auto-selected tracks are copied to the clipboard. If no tracks are auto-selected, selected clips on all tracks are copied.

When clips are pasted in the Final Cut Pro 4.1 Timeline, they are placed according to auto-selected tracks, not destination tracks, and the following Auto Select rules apply:

- If there are no auto-selected tracks, tracks V1 and A1 are used by default.

- When pasting multiple clips, the relative track placement of the copied clips is always maintained. For example, two video clips copied from tracks V1 and V3 will maintain the one-track gap between them when pasted. Audio track clip relationships are maintained similarly, and they are independent from video track clip relationships.

Note:he examples above show that only one auto-selected audio track is necessary to determine where the audio pair will be pasted. The same is true when pasting multiple video clips.

- The lowest numbered auto-selected tracks are used. For example, if tracks V2, V3, A3, and A4 are auto-selected, tracks V2 and A3 are used.

- Pasting linked video and audio clips requires both auto-selected video and audio tracks. If only one type of track is auto-selected, Final Cut Pro automatically determines the other track: Video track V1 corresponds to audio tracks A1 and A2, video track V2 corresponds to audio tracks A3 and A4, and so on. For example, if you auto select track V2 (and no audio tracks), linked audio clips will be pasted automatically in audio tracks A3 and A4. Auto-selecting specific tracks overrides this rule.

Tips for Faster Copying and Pasting
Since the lowest numbered auto-selected video and audio tracks determine where clips will be pasted in the Timeline, you can save time by choosing only one video and audio auto-selected track.

To auto select a single video or audio track:

- Option-click the Auto Select control for the single track you want to auto select.

FireWire: External Drive Data Transfers Slow During Video Conference

- **Last Modified:** June 11, 2007
- **Article:** TA27548

- **Old Article:** 93498

Transfer rates for external FireWire drives may slow down while video conferencing with a FireWire camera such as the iSight.

Products Affected

iSight

Because the computer gives video and audio data priority over file transfers, data transfer rates will slow down when transferring large files from the computer's internal drive to an external FireWire drive while an iSight (or any third-party FireWire camera) is previewing or streaming video in a chat.

To avoid this situation, don't transfer large files to an external FireWire drive when you are using a FireWire camera to stream video.

DVD Studio Pro 2.0.5 Enhancements

- **Last Modified:** March 15, 2004
- **Article:** TA27549

- **Old Article:** 93500

Learn about enhancements in DVD Studio Pro 2.0.5.

Products Affected

DVD Studio Pro

The DVD Studio Pro 2.0.5 update is strongly recommended for all users of DVD Studio Pro 2 creating DVD-9 projects. This update improves the placement of the dual-layer break point.

For additional information regarding the full contents of this update, please refer to the DVD Studio Pro Late-Breaking News located in the Help menu.

Previous DVD Studio Pro 2 Enhancements
The following enhancements were included in earlier DVD Studio Pro 2 updates.

PAL Projects Using the 2.0.3 Release
The DVD Studio Pro 2.0.3 release introduced an issue in PAL projects using still images. Still menus, slideshows or tracks containing stills, are being scaled incorrectly in PAL projects. NTSC projects are not affected by this issue.

Note: When PAL projects with still images are played back from the Simulator, they will appear to be scaled correctly. However, when played back in a DVD player, any still images in the project will appear incorrectly scaled and cropped.

Additional MPEG-2 Resolutions Now Supported
DVD Studio Pro now supports the cropped D-1, 1/2 D-1, and SIF MPEG-2 video resolutions.

Following is a list of supported MPEG-2 video resolutions:

- Full D-1: 720 x 480 NTSC, 720 x 576 PAL
- Cropped D-1: 704 x 480 NTSC, 704 x 576 PAL (matches analog blanking)
- 1/2 D-1: 352 x 480 NTSC, 352 x 576 PAL
- SIF (Standard Interface Format): 352 x 240 NTSC, 352 x 288 PAL

There are several things to be aware of when using these resolutions in a track:

- While a project can contain a combination of the three supported video resolutions, all video clips within a track must use the same video resolution. For example, if you have a full D-1 and a 1/2 D-1 video asset, they cannot be used within the same track, but could be used within separate tracks in the same project.
- The embedded MPEG encoder only encodes with the full D-1 resolution. When you add QuickTime assets to a track, the entire track must only contain full D-1 resolution clips.
- Still images are encoded as full D-1 MPEG-2 assets. Any tracks you add still images to must only contain full D-1 resolution clips.

When creating standard menus, you can assign assets using any of the three supported video resolutions to drop zones and buttons. Since menus are rendered as part of the build process, you can mix video resolutions as required in your menus.

Trimming Clips Precisely Is Now Easier
If you decide to trim a track's clip by entering a new Clip Start Time in the Clip Inspector, the clip's Duration setting automatically changes to accommodate the new start time. Earlier versions of DVD Studio Pro 2 required you to first enter a shorter duration before entering a new start time.

Subtitle Clips Can Now Cross Markers
Subtitles that cross chapter markers are now automatically split into multiple subtitle clips at each marker when you build your project. The DVD-Video specification does not allow subtitles to extend across chapter markers. By splitting a single long subtitle clip at each chapter marker as part of the build process, DVD Studio Pro allows you to create the impression of one long seamless subtitle clip.

Illegal Still Clip Lengths Disallowed
DVD Studio Pro now restricts the minimum still image clip length to 15 frames in NTSC projects, and to 12 frames in PAL projects. These minimums also apply to stills within a slideshow.

Final Cut Pro 4.1: "Out of Memory" Error With Less Than 384 MB of RAM

- **Last Modified:** December 04, 2003
- **Article:** TA27550

- **Old Article:** 93501

If you try to use Final Cut Pro 4.1 on a computer that has less than 384 MB of memory installed, an "Out of Memory" message will appear.

Products Affected

Final Cut Pro

Final Cut Pro 4 requires 384 MB of RAM, and 512 of RAM for RT Extreme. Using the program on a computer that has less than 384 MB of memory installed will result in "Out of Memory" message when you open a sequence.

To resolve this issue, upgrade the computer's RAM to at least 384 MB. 512 MB of RAM is required to use RT Extreme effects and to use Soundtrack.

Complete system requirements for Final Cut Pro 4 can be found on the Final Cut Pro Technical Specifications page (http://www.apple.com/finalcutpro/specs.html).

iPod software 2.1: About Windows ME Support

- **Last Modified:** June 07, 2007
- **Article:** TA27553

- **Old Article:** 93506

Products Affected

iPod, iPod, Windows OS

To use an iPod that has iPod 2.1 or later software with Microsoft Windows ME, you'll first need to restore iPod to a previous version of the software.

Windows ME works with iPod software 1.3 through 2.0.2. Windows ME does not work with iPod software 2.1 or later or with iPod mini software 1.0 or later.

To use an iPod that has iPod software 2.1 with Windows ME, restore your iPod using the original CD that came with it.

If your iPod is repaired, chances are it will come back with the latest version of iPod software. In this case, you'll need to restore it to a previous version.

Note: iTunes for Windows (and iPod models that come with iTunes) only work with Windows Vista, Windows XP, and Windows 2000.

DVD Studio Pro 2.0.4: About Dual-Layer Break Points

- **Last Modified:** February 13, 2004
- **Article:** TA27556

- **Old Article:** 93514

Learn about how DVD Studio Pro has changed the default dual-layer break point flag starting with the DVD Studio Pro 2.0.3 update and how to modify the default setting.

Products Affected

DVD Studio

DVD Studio Pro has changed the behavior of the dual-layer break point starting with version 2.0.3. It now forces a pause during playback of DVD-9 projects while the DVD player switches to the second layer. While this change to a non-seamless dual-layer break point will increase compatibility of your DVD project with DVD players, you may still wish to use the seamless method.

To override the default and create DVD-9 projects with seamless dual-layer break points:

1. Open Terminal (Applications/Utilities).
2. Type "`defaults write com.apple.dvdstudiopro SeamlessLayerBreak YES`" at the command prompt and press Return. (With this setting, DVD Studio Pro versions 2.0.3 and later will create a DVD-9 with no pause when switching layers, but it may be incompatible with some players.)

To return to the default and create DVD-9 projects with non-seamless dual-layer break points:

1. Open Terminal (Applications/Utilities).
2. Type "`defaults write com.apple.dvdstudiopro SeamlessLayerBreak NO`" at the command prompt. (With this setting, DVD Studio Pro versions 2.0.3 and later will create a more compatible DVD-9 with a slight pause when switching layers. This is the default setting.)

To verify the setting:

1. Open com.apple.dvdstudiopro.plist in ~/Library/Preferences/ with a text editor. **Note**: The Tilde (~) represents your home directory.
2. Search for "SeamlessLayerBreak".

    - If the value for "SeamlessLayerBreak" is set to "YES", seamless dual-layer break points will be used.
    - If the value for "SeamlessLayerBreak" is set to "NO", non-seamless dual-layer break points will be used.

Note: The Seamless/Non-Seamless flag is set only during the DDP or CMF formatting process.

Songs from iTunes Store do not copy to your iPod

iTunes does not copy purchased songs to your iPod if its software is too old.

Products Affected

iPod, iTunes, iTunes Store

This article has been archived and is no longer updated by Apple.
If either of the following occurs, download and install the latest software for your iPod.

- Songs you purchased from the iTunes Store don't appear on your iPod.
- When you update the music library on your iPod, this message appears:

  "Some of the songs in the iTunes music library, including the song "<song name>", were not copied to the iPod "<iPod name>" because they cannot be played on an iPod."

Tip: This can also occur if the computer you are using is not authorized to play the songs you purchased. Try to play one of the songs on the computer. The song will either play or you will be prompted to authorize it.

iPod (with Dock Connector): About Locked Photos and the Belkin iPod Media Reader

- **Last Modified:** July 01, 2004
- **Article:** TA27560

- **Old Article:** 93523

If you select the "erase card" option when you copy files to your iPod, photos you locked on your camera are erased.

Products Affected

iPod

When you transfer photos from a memory card to your iPod, all the photos on the card are erased if you select the "erase card" option. This includes photos you may have locked or protected with the camera. There should be nothing to worry about. All the photos that were on the memory card are on your iPod.

iPod (with Dock Connector): Voice Memo Name Does Not Exactly Match Time Created or Modified

- **Last Modified:** December 15, 2003
- **Article:** TA27561

- **Old Article:** 93526

The time stamp of an iPod voice recording may differ from the modified or created times that the computer's operating system shows for that file.

Products Affected

iPod

The filename of the recording is created when the recording screen on iPod appears. The file's creation date is set approximately two minutes into the recording when the file is first written to iPod's hard disk. The file's modification date is the time when the file was last changed, typically the time the recording ended.

Soundtrack 1.1: Late-Breaking News

- **Last Modified:** December 09, 2003
- **Article:** TA27563

- **Old Article:** 93533

This document contains late-breaking information about Soundtrack 1.1.

Products Affected

Soundtrack Pro, Final Cut Pro

Late-Breaking News About Soundtrack

This document contains late-breaking information about Soundtrack. For the latest information about product updates, tips and techniques, and qualified third-party devices, visit the Soundtrack website at **http://www.apple.com/soundtrack**.

Exporting Projects and Tracks
When exporting a project mix or a track, the length of the export file runs from the beginning of the playback region to the end of the playback region if a playback region exists. If no playback region exists, the export file runs from the beginning of the project to the end of the last audio clip in the project. If the project contains effects that produce sound beyond the end of the last audio clip, then the export file will extend beyond the last audio clip until the effects stop generating sound.

Duration of Exported QuickTime Files
When exporting a project to a QuickTime movie file, the export file runs from the beginning of the project to either the end of the video file or the end of the last audio clip in the project, whichever is later. The complete video is exported, even if it runs past the end-of-project marker. If the project contains effects that produce sound beyond the end of the last audio clip, then the export file will extend beyond the last audio clip until the effects stop generating sound.

Projects exported to QuickTime are exported at a bit depth of 16 bits, whether the Export Bit Depth setting in the Project pane of the Preferences window is set to a bit depth of 16 bits or 24 bits. QuickTime is limited to an export bit depth of 16 bits.

Some video files with a .mov extension, particularly video files created using some versions of iMovie 3, may not be in a standard QuickTime movie format. If you try to export a project with a video file, and see an alert that the video is not a standard QuickTime movie, export the video from another application such as Final Cut Pro or QuickTime Pro to create a standard QuickTime movie of the file before exporting to QuickTime in Soundtrack.

Long Audio Files May Cause Performance Problems
Adding audio files of more than several minutes' length, or recording audio continuously for several minutes or more, may cause performance problems or result in the application quitting unexpectedly. Previewing extremely long audio files may cause a delay while the file is read into memory. If you experience problems caused by either adding extremely long audio files or recording for long periods of time, installing additional RAM in your computer may help.

Deleting Files in a Project
When a media file has been added to the Timeline of a project, and you move the file to the Trash, and then close the project, the file cannot be deleted from the Trash. An alert appears, saying that the file is still in use. To delete the file, quit Soundtrack, and then empty the Trash.

Similarly, when an audio file has been opened in Soundtrack Loop Utility, and you move the file to the Trash and then close the Soundtrack Loop Utility window, the file cannot be deleted from the Trash. An alert appears, saying that the file is still in use. To delete the file, quit Soundtrack Loop Utility, and then empty the Trash.

Placing Beat, Time, and Scoring Markers
If a beat marker or a time marker is placed at the same position as a Final Cut Pro scoring marker, the beat or time marker cannot be moved or deleted. Video Files Located on a Server May Lose Synchronization During Recording When you record audio in a project that contains a video file, if the video file is located on a server, the video's audio may not be synchronized with the project while recording. You may also experience Write errors while recording. To eliminate the problem, download the video file to your computer's hard disk. Similarly, it is generally not a good idea to use a server as your Recording Sessions Location found in the Recording tab of Soundtrack Preferences.

Importing a Video File With Audio Tracks
When you import a video file into a Soundtrack project, and the video file contains multiple audio tracks, only the first audio track is imported into the project.

Using Small Screen Resolutions
Soundtrack is intended to be used at a screen resolution of 1024 X 768 pixels or higher. If your computer is set to a screen resolution smaller than 1024 X 768, layouts may not display correctly, and changing the layout may cause unpredictable screen behavior.

Using Ripple Delete, Ripple Cut, and Paste Insert Commands With Timeslices
In addition to cutting, copying, pasting, and deleting Timeslices, you can also perform a ripple delete, ripple cut, and paste insert of Timeslices. When you cut or delete a Timeslice, a gap is left in the project Timeline where the deleted content existed. When you ripple cut or ripple delete a Timeslice, the gap is closed; the content to the right of the Timeslice selection moves to close the gap.

When you paste a cut or copied Timeslice, the pasted content is inserted into the Timeline at the position of the playhead and replaces any content that already exists at the playhead location. When you use a paste insert on a cut or copied Timeslice, the pasted content is inserted into the Timeline at the position of the playhead; content to the right of the playhead moves over to make room for the Timeslice being paste inserted.

Changing the Levels of Multiple Tracks at the Same Time
Pressing the Command key while dragging a track's volume slider changes the volume for that track and any other selected track. Each track's volume is changed at the same time, by the same amount. For instance, if you Command-drag a track's volume slider, increasing the volume by 3 decibels (dB), the volume for all selected tracks increases by 3 dB. This allows you to make changes to multiple track volumes at the same time.

Making Volume Envelope Adjustments
If you select a volume envelope, you can adjust all envelope points of a track by a specific decibel value. Choose Edit > Adjust Volume Envelope, then enter a new value in the decibel field. Positive numbers raise the volume, and negative numbers lower it.

Note: Adjustments made to the entire volume envelope that place the audio above +6 dB or below -96 dB will cause the volume envelope to change shape. If you make a volume adjustment that changes the shape of the volume envelope, a warning appears, allowing you to cancel the action.

Mute Always Overrides Solo
When both the Mute and the Solo buttons are selected simultaneously, Mute will always override Solo. For instance, if you have multiple percussion tracks soloed, you can mute one track or multiple tracks to hear individual volume levels in relation to each other. As you unmute each track, those percussion tracks will still be soloed.

Solo Doesn't Affect Preview
If you solo a track, Preview will still play. This allows you to preview different drum loops with a soloed guitar, for example.

Viewing a File's Information Within a Track
Soundtrack allows you to view a file's information within a track. Control-click a selected audio region, then choose Show File Information from the shortcut menu. The same information can also be found in the Media Manager.

Playing a Project From the Beginning
If you want to play your project from the beginning, press Shift-Return. If you have set up a playback region and the playhead is within it, the playhead moves to the start of the playback region. Otherwise, it moves to the start of the project when the playhead is before the playback region, and to the start of the playback region when the playhead is after the playback region.

Changing the Speed of Audio Loops
You can quickly change the speed of multiple audio loops by Control-clicking an audio region, then choosing Clip Speed and the new speed from

the shortcut menu. To return to the original loop's speed, choose Clip Speed > Normal from the shortcut menu.

Using Undo in Soundtrack Loop Utility
When you choose Edit > Undo in Soundtrack Loop Utility, the text is removed from the current and previously selected text fields.

Create Support Profile Has Been Added to the Help Menu
There are certain support situations in which AppleCare may require information about both your computer and how this particular application is configured. Choosing Help > Create Support Profile creates a file that contains the necessary information and can be emailed to AppleCare. You would not normally use this feature unless directed to by an AppleCare representative.

New Apple Applications Page for Pro Apps Developers
The Apple Developer Connection website has launched a new page, Apple Applications, that is a one-stop destination for developers creating content or extensions for Pro Applications. On this page, developers can find late-breaking news of interest and technical resources such as developer documentation, special articles, and SDKs. Developers can also sign up for a new Pro Apps Developer mailing list. The URL is http://developer.apple.com/appleapplications.

Final Cut Pro 4: LiveType - Backward Compatibility

- **Last Modified:** October 04, 2008
- **Article:** TA27564

- **Old Article:** 93538

Older versions of LiveType cannot open projects created in newer versions of LiveType.

Products Affected

Final Cut Pro

Differences in project files make it so that projects created in newer versions of LiveType may not work with older versions. For instance, a project created in LiveType 1.2 is not supported by LiveType 1.0.

Tip: Only edit LiveType projects with the same version of the software in which it was created, or later.

Archived - DVD Studio Pro 2: Using .CC Files

DVD Studio Pro may not accept closed caption files with the filename extension ".cc".

This article has been archived and is no longer updated by Apple.

Page 519 of the DVD Studio Pro User's Manual mistakenly states, "DVD Studio Pro supports closed caption files in the ".cc" and ".scc" formats".

To use closed caption files in DVD Studio Pro 2, change the filename extension from ".cc" to ".scc".

Example: Rename "Movie_Captions.cc" to "Movie_Captions.scc".

iDVD: "Multiplexer Preparation Error"

- **Last Modified:** June 08, 2007
- **Article:** TA27570

- **Old Article:** 93553

If there isn't enough room on your computer's hard disk, a multiplexer preparation error may appear when you try to burn a DVD.

Products Affected

iDVD

Symptom

The following message appears when you try to burn a DVD:

> "Multiplexer preparation error: Not enough free disk space for encoding the remaining assets."

Solution

Before burning your iDVD project, make sure there is at least 10 GB of hard disk space available on your Mac OS X startup volume. This will ensure that there is enough space for the elements of your iDVD project to be encoded into the DVD-Video format. It will also keep your hard disk from becoming completely full, which could degrade its performance.

Final Cut Pro 4: General Error With a Red Screen in Canvas Window

Batch capture clips longer than 15 minutes instead of using Capture Now if you intend to apply speed.

Products Affected

Final Cut Pro

This article has been archived and is no longer updated by Apple.

Symptom

A General Error appears and the Canvas window is red.

This happens after you apply speed to a clip captured via Capture Now that is more than 15 minutes long.

Solution

To avoid this, recapture the affected clips using batch capture.

1. Select the clips in the Browser.
2. From the **Modify** menu, choose **Make Offline**. The Make Offline dialog appears.
3. Select "Delete Them from the Disk" and click OK.
4. Conduct a batch capture of the same clips in order to acquire fresh media for the same media start and media end points.

iPod mini: Frequently Asked Questions

Learn about iPod mini and where to get more information.

Products Affected

iPod

This article has been archived and is no longer updated by Apple.

Question 1: What are the system requirements for iPod mini?

Answer: See "iPod System Requirements".

Question 2: How is iPod mini different from other iPods?

Answer: iPod mini is designed to hold 1000 of your favorite songs and go everywhere you go. iPod is designed to hold your entire music collection - up to 10,000 songs - and go anywhere you go.

iPod mini has the same software features as iPod, except support for voice recording and photo storage. If you require those features, purchase iPod rather than iPod mini.

Question 3: Can I use older technology, such as peripherals, cards, software, and accessories, with this new product?

Answer: See "iPod mini: About Using Older Accessories"

GarageBand: "Error while trying to synchronize Audio and MIDI"

- **Last Modified:** October 04, 2008
- **Article:** TA27582

- **Old Article:** 93573

Plugging and unplugging audio devices to the computer's audio input port can cause an error.

Products Affected

GarageBand

Symptom

This message appears during audio playback:

> "Error while trying to synchronize Audio and MIDI"

In some cases the error will continue to appear even after clicking Continue.

This can occur if you plug and unplug an audio device into the computer's audio input port several times while audio is playing.

Solution

If this happens, stop playback, and start it again.

GarageBand: Set the Song's Key Before Recording MIDI

Make sure to set a song's key before recording any MIDI notes.

Products Affected

GarageBand

This article has been archived and is no longer updated by Apple.
GarageBand creates new songs with a default key of C. If you decide to change the key later, all of your MIDI notes will be transposed to the new key. To avoid having to transpose your software instruments, be sure to set the song's key before recording anything.

To change the song's key:

1. Click the Track Info button to open the Track Info window.
2. From the pop-up menu at the top of the window, choose **Master Track**.
3. From the **Key** pop-up menu, choose a new key.

If you've already recorded a track in the wrong key, use the Transpose slider in the Track Editor to adjust the pitch of the region.

GarageBand: About Exporting Songs With Unicode Characters in Mac OS X 10.2

- **Last Modified:** May 18, 2004
- **Article:** TA27591

- **Old Article:** 93588

In Mac OS X 10.2, GarageBand cannot export a song to iTunes if the song title includes Unicode characters such as those you'd use with the Kotoeri or Traditional Chinese input methods.

Products Affected

GarageBand, iTunes

Symptom

When exporting a song to iTunes, nothing happens.

This happens if the song title contains Unicode characters such as those you'd use with the Kotoeri or Traditional Chinese input methods.

Solution

Update to GarageBand 1.1 or later to resolve this.

GarageBand: Supported Audio Formats

- **Last Modified:** January 16, 2004
- **Article:** TA27592

- **Old Article:** 93589

Learn about the audio formats supported in GarageBand.

Products Affected

GarageBand

For Recording
GarageBand supports recording at 16 bit/44.1 kHz. Other formats, such as 48 kHz audio, are not supported for recording. GarageBand will change the format for the selected audio device if possible.

For Importing
You can import AIFF and WAV files as long as they are 16 bit. If you import an MP3 file, it will be converted and stored in your project as an AIFF file.

Learn about the system requirements for using iMovie 4.

Products Affected

iMovie

The system requirements for iMovie 4 are:

- Power Macintosh, Power Mac, PowerBook, iMac, eMac, or iBook with a G3 processor or better, at 400 MHz or faster.
- Mac OS X 10.2.6 or later.
- QuickTime 6.4 or later.
- FireWire port.
- 256 megabytes (MB) of random-access memory (RAM).
- 2 gigabytes (GB) of free hard disk space.
- Screen resolution of 1024 x 768 or higher.

iPhoto: Camera's Orientation May Not Be Respected on Import

iPhoto and Image Capture may not recognize instructions or tags from certain cameras that tell iPhoto to rotate an image when it's imported.

Products Affected

Mac OS X 10.3, iPhoto

This article has been archived and is no longer updated by Apple.

Symptom

Photos imported into iPhoto or Image Capture are not automatically rotated when you import them.

Solution

Download and install Mac OS X 10.3.3 Update or later to avoid this issue.

If you're not ready to install, these tips can help:

After importing your photos, rotate them in iPhoto or Image Capture.

Alternatively, if the camera or its memory card appears on Desktop, you can drag the photos in the Finder to the iPhoto window. This will import the photos and rotate the images automatically if you've rotated them on the camera.

"Attached iPod model is not supported by this application" alert

- **Last Modified:** January 08, 2007
- **Article:** TA27605

- **Old Article:** 93613

Products Affected

iPod mini, iPod, iPod

If your iPod mini came preinstalled with iPod mini Software 1.2 or later or your iPod (Click Wheel) came with iPod Software 3.0.2 or later, you cannot use an iPod Updater prior to iPod Updater 2004-11-15. If you try to, you will see the following alert:

> The attached iPod model is not supported by this application.

If you recently purchased a new iPod, make sure that you install the software from the CD that came with your iPod, or check iPod downloads for the latest updater. If you try to use the original iPod mini Software 1.0 Updater on an iPod that isn't an iPod mini, you will get the same alert.

Find out which iPod model you have and the latest version of iPod Software that is available for it.

Archived - Using an iPod with a Click Wheel

Products Affected

iPod, iPod (5th generation), iPod mini, iPod nano, iPod photo

This article has been archived and is no longer updated by Apple.

Newer iPod models have a "Click Wheel." If you're not sure what your iPod model you have or if it has a Click Wheel, check this document. You use the Click Wheel to scroll through menus and playlists. In addition to scrolling, you use the Click Wheel's buttons, Menu, Play/Pause, Previous/Rewind, and Next/Fast-forward to navigate between menus and play songs.

Click wheel

To scroll through menus and lists, move your thumb or finger lightly around the Click Wheel. To activate a button, press its label. The buttons on the Click Wheel are not touch-sensitive buttons. The buttons are located underneath the Click Wheel and are activated when you press down on the desired label on the Click Wheel. If you are having difficulty, be sure you are pressing along the edge of the wheel and not near the center.

In the middle of the Click Wheel is the Center button. The Center button is not part of the Click Wheel. Press the Center button to select the highlighted option on the iPod screen. The Center button is not a touch-sensitive button.

When backlighting is turned on, only the display is illuminated, not the buttons like earlier iPod models.

Note: If the Click Wheel stops responding, do not touch the Click Wheel for a couple of seconds and it should start responding as normal.

GarageBand 1: Optimizing Performance

- **Last Modified:** June 07, 2005
- **Article:** TA27607

- **Old Article:** 93618

GarageBand performance depends on your computer's processor speed, the amount of memory installed, the speed of your hard disk, and the complexity of the song you are playing. Performance can affect whether a song plays and how many tracks, instruments, notes, and effects it can have.

Products Affected

GarageBand

While a song is playing, the playhead changes color from yellow through orange to red to show how much of your computer's processing power is being used to play the song. Yellow indicates moderate processor use, orange indicates high processor use, and red indicates that the song is close to not being able to play completely. If this occurs, a dialog will appear.

To optimize performance, try one or more of the following:

- Quit other open applications.
- Mute some tracks in the song.
- Turn off some effects, especially more complex effects such as Amp Simulation.
- If the song uses many Software Instrument tracks, convert some Software Instrument regions to Real Instrument regions. To learn how, see the "Tips" page.
- Open System Preferences, click the Energy Saver tab, click the Options button, then choose "Highest" from the Processor Performance pop-up menu. Click the Sleep button, then turn off "Put hard disk(s) to sleep when possible."
- Choose GarageBand > Preferences, click the Audio/MIDI tab, then click the "Maximum number of simultaneous tracks" button in the "Optimize for" section.
- Choose GarageBand > Preferences, then click the Advanced tab. Choose lower settings from the "Real Instrument Tracks", "Software Instrument Tracks"or "Voices per instrument" pop-up menus in the Advanced pane.
- FileVault can cause reading data from your Home directory to be significantly slower. To improve performance, open System Preferences, click the Security tab, and turn off FileVault, or move and keep your songs outside of your Home directory.
- Your computer can read data more quickly from its hard disk than from removable media, such as a CD or DVD. Copy songs to your computer's hard disk before playing them.
- Some external hard disks may read data more quickly than your internal hard disk. If you have a high-speed external hard disk, try copying

songs to it before playing.

About the Apple In-Ear Headphones

- **Last Modified:** June 13, 2007
- **Article:** TA27608

- **Old Article:** 93619

Learn about the Apple In-Ear Headphones.

Products Affected

iPod

In-Ear Headphones

The Apple In-Ear Headphones are an optional accessory you can use with all iPod models and any computer or audio equipment that has a 3.5 mm stereo minijack.

The earbud-style headphones included with iPod should not be confused with the Apple In-Ear Headphones.

Ear Caps

The Apple In-Ear Headphones come with three sets of ear caps. Each set is a different size: small, medium, or large. The size of each cap (S, M, or L) is marked in small print on a tab inside the cap. The size you install on the headphones depends on the size of your ear canal. The medium-size ear caps are preinstalled at the factory.

Three different sizes of ear caps

To attach a different size ear cap:

1. Pull the ear cap off of the headphone base.
2. Align the tab inside the new ear cap with the groove on the headphone base.

3. Push the ear cap onto the base.

(A) Size tab (B) Groove

Storage Case

The Apple In-Ear Headphones come in a special storage case. It's designed to properly store the ear caps, headphones, and cable.

In-Ear headphones storage case

To remove the headphones from the case, take off the plastic top.

To properly store the headphones in the storage case, wind the cable around the side of the case.

Side view with headphones cable wound around the case

Irritation

Some individuals may be sensitive to silicone rubber used in the ear caps. If rash or other skin conditions develop, discontinue use. If the condition persists, consult a physician.

GarageBand: iTunes opens in Classic when you export

- **Last Modified:** May 18, 2004
- **Article:** TA27611

- **Old Article:** 93622

Learn how to prevent iTunes from opening in Classic when exporting from GarageBand.

Products Affected

GarageBand, iTunes

Symptom

When you export a song to iTunes from GarageBand, an earlier version of iTunes opens in Classic.

Solution

Update to GarageBand 1.1 or later to prevent this from occurring.

iTunes 4: Join CD Tracks Command Is Dimmed

- **Last Modified:** January 23, 2004
- **Article:** TA27612

- **Old Article:** 93624

The Join CD Tracks command in iTunes is dimmed if you select files in the library, noncontiguous tracks on an audio CD, or when the audio CD is sorted by something other than track number (like Album or Artist).

Products Affected

iTunes

Symptom

The Join CD Tracks command in the Advanced menu is dimmed.

Solution

1. Make sure you have selected tracks on an audio CD and not files that are already in your library.
2. Make sure the songs you selected on the Audio CD are contiguous. See Figure 1.
3. Make sure the audio CD is sorted by track number in ascending order. To do this, click the column header for the leftmost column in iTunes until it is blue and contains a triangle that points up. See Figure 1.

Figure 1 Contiguous tracks selected on a CD with tracks sorted in ascending order

iDVD 4: Slideshow Audio Using Playlist Repeats First Song

- **Last Modified:** October 04, 2008
- **Article:** TA27617

- **Old Article:** 93646

On burned discs, a slideshow will repeat the first song of an iTunes playlist instead of playing the whole list.

Products Affected

iDVD, iTunes

Symptom

If you use an iTunes playlist to accompany your slideshow it will play the songs in their correct order in Preview mode, but incorrectly repeats the first song on the burned disc.

Solution

Please update to iDVD 4.0.1 or later. This update is also available through Software Update in System Preferences.

iTunes for Windows: Only First Audio CD Is Recognized

- **Last Modified:** January 27, 2004
- **Article:** TA27618

- **Old Article:** 93647

Find out what to do if iTunes only recognizes the first audio CD you put in the computer's drive.

Products Affected

iTunes

Symptom

iTunes only recognizes first audio CD you put in the computer's drive. Other CDs don't appear in iTunes.

Solution

1. Click the Start button then point to Run.
2. In the Run window, type "msconfig" in the Open field.
3. Click OK.
4. Click the Startup tab in the System Configuration Utility window.
5. Locate the item from the list named "Shwicon2k" and deselect it.
6. Click OK.
7. Restart the computer. Upon restart, this message appears: "You have used the System Configuration Utility to make changes to the way Windows starts."
8. Click the "Don't show this message or launch the System Configuration Utility when Windows starts" checkbox.
9. Click OK.

DVD Studio Pro 2: About Aligning Text With Keyboard Shortcuts

- **Last Modified:** January 27, 2004
- **Article:** TA27620

- **Old Article:** 93653

Learn how to keep text in objects or buttons justified when you change the text using keyboard shortcuts.

Products Affected

DVD Studio Pro

If you use keyboard shortcuts to set the alignment of text in text objects or buttons, the text alignment will be overridden if you change the text later.

For example, if you create a text object on a menu, type two lines of text, press Shift-Command-], and deselect the text object, the two lines of text will right-align. If you then select a word in one of the lines and change its color, font, or spelling, the text changes back to its original alignment (as controlled by the Text Object Inspector). You can work around this issue by using the alignment controls in the Text Object or Button Inspector instead of keyboard shortcuts.

This document will be updated when additional information is available.

iDVD 4: Disc doesn't burn on dual processor Power Mac G5 computers

- **Last Modified:** October 04, 2008
- **Article:** TA27629

- **Old Article:** 93665

iDVD 4 may not successfully burn a disc on dual processor Power Mac G5 computers if Best Performance is selected in iDVD preferences.

Products Affected

iDVD, Power Mac G5

Please update to iDVD 4.0.1 or later. This update is also available through Software Update in System Preferences.

After you have updated to iDVD 4.0.1, it may be necessary to delete encoded assets from your iDVD 4 project.

iPhoto: Tip - How to Remove a Photo From a Smart Album

Learn how to remove a photo from a Smart Album.

Products Affected

iPhoto

This article has been archived and is no longer updated by Apple.
Until you remove a photo from a Smart Album, you won't be able to delete it. This might appear to be an issue when:

- Dragging the photo to the Trash icon in the iPhoto window, or by pressing Command-Delete.
- Clicking the Trash button during a Smart Album slideshow. (The button appears to respond, but the photo isn't deleted.)

To remove a photo from a Smart Album, change the criteria used to define the album, or edit the photo so that it no longer meets the album's criteria.

For example, change the photo's rating so it no longer matches the rating threshold for the album.

If you want to remove a photo from the Library, and not just an album, select the photo and press Command-Option-Delete. This will move the photo to the Trash and remove it from all albums (including Smart Albums).

iTunes: About Adding Artwork to WAV Files

- **Last Modified:** February 06, 2004
- **Article:** TA27633

- **Old Article:** 93672

The WAV file format doesn't allow you to add artwork in iTunes.

Products Affected

iTunes

To add artwork to a WAV file, convert it to a different format that supports artwork, such as MP3 or AAC. You can do this in iTunes. See technical document 93123, "**iTunes 4: How to Convert a Song to a Different File Format**", for assistance in converting a file.

iPod: Tip - See your contacts faster

- **Last Modified:** November 18, 2005
- **Article:** TA27637

- **Old Article:** 93676

Products Affected

iPod photo, iPod nano, iPod mini, iPod, iPod, iPod (5th generation)

Contacts on your iPod are saved as vCards (.vcf files). For best performance, save all of your contacts in a single vCard instead of saving a card per contact. Each contact will still appear individually, but your iPod will be able to open the contacts much faster.

Check the documentation that came with your contact software, or call the software publisher to see how to save all your contacts in a single vCard.

Tip: If you use iSync, all your contacts are saved to iPod in a single vCard.

TA27637_iPod_Tip_-_See_your_contacts_faster.pdf

DVD Studio Pro 2 - Too many combined chapters and end actions in movie

- **Last Modified:** October 04, 2008
- **Article:** TA27638
- **Old Article:** 93681

In addition to the limit of 99 chapter markers per track, DVD Studio Pro 2 has a combined limit of 106 chapter markers and individual chapter end jump settings per track. This is normally not an issue except in special cases where the author decides to set an end jump for each chapter marker.

Products Affected

DVD Studio Pro

If your track has 54 chapter markers, each configured with an end jump, the result is a combined 108 markers and jump settings, which causes an error message to appear when you build the project. Since setting end jumps on chapter markers prevents the track from playing seamlessly from start to end, you can instead divide the track into two tracks, each containing a portion of the markers, avoiding the 106 setting limit.

Why Would You Do This?

You might use chapter markers with end jumps set to "edit" a track into multiple small clips. If you configure a menu button to jump to a specific chapter marker, the track starts playing at that point. Once the next marker is reached, the end jump directs the DVD player back to the menu, resulting in only a small portion of the track playing.

The advantage of this is that you can easily configure a track to play as short clips and not worry about running into the 99 tracks, stories, and slideshows per project limit. The disadvantage is that you cannot play the track from start to end. As soon as the first marker that has its end jump set is reached, the player jumps to that setting.

Using Stories

You can accomplish a similar result by creating a story that plays only from one chapter marker to the next. The disadvantage of doing this is that if you have a lot of these that you want to configure, you will quickly run into the 99 tracks, stories, and slideshows per project limit.

iDVD 4/5: Where are the older themes?

- **Last Modified:** May 25, 2005
- **Article:** TA27640

- **Old Article:** 93686

Themes from iDVD 1 and iDVD 2 are not included in iDVD 4 or iDVD 5 unless you upgrade from iDVD 3.

Products Affected

iDVD

If you upgrade from iDVD 3 to iDVD 4 or later, the themes from iDVD 1 and iDVD 2 are copied to the new version of iDVD. You can use them in your iDVD 4 or iDVD 5 projects.

If iDVD 3 is not installed on your computer when you install iDVD 4/5, or if you changed the name or location of iDVD 3 before installing, the older themes from iDVD 1 and iDVD 2 will not be available. You'll still be able to open projects created in iDVD 1 and iDVD 2, but they will use the iDVD 4 or 5 default theme. Copying the themes is not an option due to changes with menus that occurred in iDVD 3.

QuickTime for Windows 6.5: "No Disk, Please Insert Disk In Drive D" Message

Products Affected

QuickTime, iTunes

This article has been archived and is no longer updated by Apple.

Find out what to do if a message asks you to insert a disk when you open QuickTime Player.

Symptom

This message appears when you open QuickTime Player: "No Disk, Please Insert Disk In Drive D".

Solution

Clear your list of recently viewed movies. To do so, follow these steps:

1. Open QuickTime Player.
2. From the **File** menu, choose **Open Recent**, then choose **Clear Menu**.

This may also occur after installing iTunes for Windows (which also installs QuickTime). Use the same steps as above to resolve this.

Final Cut Pro 3: Canon Digital Camera Compatibility

- **Last Modified:** February 18, 2004
- **Article:** TA27643
- **Old Article:** 93692

This document provides additional compatibility notes for Sony consumer and professional digital cameras when used with Final Cut Pro 3.

Products Affected

Final Cut Pro

This is document does not contain a full list of qualified devices, only additional information on certain models. For a complete list for Final Cut Pro 3 see document 93261 "**Final Cut Pro 3: Camera Compatibility Information**." A complete list of qualified devices for the current version of Final Cut Pro can be found at the Apple web site (http://www.apple.com/finalcutpro/qualification.html).

For additional assistance with Canon digital cameras, see the Canon web site.

Digital Camera Products: (**http://www.canondv.com/**)

Click for PAL Compatibility Chart

Canon Qualified DV Camcorders and VTRs

NTSC

Model	Device Protocol	Description and Notes
Elura	FireWire Basic	This camera needs the DV Tuner 2 and CMP Override Scripts to optimize device control over FireWire with Final Cut Pro 2. These are included with Final Cut Pro 2 installer and updater CDs. Once installed, locate the folder on the CD called "Extras" and you will find "DV Tuner 2" and "CMP Override". Drag these two files into the Final Cut Pro Plugins folder before launching Final Cut Pro. These Scripts should NOT be installed when using other DV devices, unless specified. When editing to tape: On Mac OS X, the sequence comes in up to 4 frames early and duplicates the first frame for up to 18 frames. On Mac OS 9.2.2 the sequence comes in up to 1 frame early and duplicates the first frame for up to 8 frames.
Elura 2MC	FireWire Basic	When editing to tape: On Mac OS X the sequence comes in up to 6 frames early and duplicates the first frame for up to 19 frames. On Mac OS 9.2.2 the sequence comes in up to 6 frames early and duplicates the first frame for up to 16 frames.
Elura 20MC	FireWire Basic	When editing to tape: On Mac OS X the sequence comes in up to 7 frames early and duplicates the first frame for up to 15 frames. On Mac OS 9.2.2 the sequence comes in up to 7 frames early and duplicates the first frame for up to 14 frames.

Elura 40MC	FireWire Basic	With Edit To Tape this device will come in up to 6 frames early and dupe the first frame up to 19 frames.
GL1	FireWire Basic	This camera needs the DV Tuner 2 and CMP Override Scripts to optimize device control over FireWire with Final Cut Pro 2. These are included with Final Cut Pro 2 installer and updater CDs. Once installed, locate the folder on the CD called "Extras" and you will find "DV Tuner 2" and "CMP Override". Drag these two files into the Final Cut Pro Plugins folder before launching Final Cut Pro. These Scripts should NOT be installed when using other DV devices, unless specified. When editing to tape: On Mac OS X the sequence comes in up to 4 frames early and duplicates the first frame for up to 17 frames. On Mac OS 9.2.2 the sequence comes in up to 4 frames early and duplicates the first frame for up to 7 frames.
GL2	FireWire Basic	Note: Edit to Tape will be 6 frames early and duplicate the first frame of the sequence up to 18 frames.
Optura	FireWire Basic	When editing to tape: On Mac OS X the sequence comes in up to 3 frames early and duplicates the first frame for up to 10 frames. On Mac OS 9.2.2 the sequence comes in up to 3 frames early and duplicates the first frame for up to 11 frames.
Optura 100 MC	FireWire Basic	When editing to tape: On Mac OS X the sequence comes in up to 7 frames early and duplicates the first frame for up to 12 frames. On Mac OS 9.2.2 the sequence comes in up to 7 frames early and duplicates the first frame for up to 17 frames.
Optura Pi	FireWire Basic	Timecode refresh of DV tapes not recorded on the Optura Pi will stutter in Final Cut Pro 2.0 and on the Optura Pi LCD screen. This may result in dropped frame warnings, or timecode break detection warnings after capturing clips. Use only tapes that were recorded on the Optura Pi for editing. This camera needs the DV Tuner 2 and CMP Override Scripts to optimize device control over FireWire with Final Cut Pro 2. These are included with Final Cut Pro 2 installer and updater CDs. Once installed, locate the folder on the CD called "Extras" and you will find "DV Tuner 2" and "CMP Override". Drag these two files into the Final Cut Pro Plugins folder before launching Final Cut Pro. These Scripts should NOT be installed when using other DV devices, unless specified. When editing to tape: On Mac OS X the sequence comes in up to 2 frames late and duplicates the first frame for up to 6 frames. On Mac OS 9.2.2 the sequence comes in up to 2 fram es late and duplicates the first frame for up to 2 frames.
Ultura	FireWire Basic	This camera needs the DV Tuner 2 and CMP Override Scripts to optimize device control over FireWire with Final Cut Pro 2. These are included with Final Cut Pro 2 installer and updater CDs. Once installed, locate the folder on the CD called "Extras" and you will find "DV Tuner 2" and "CMP Override". Drag these two files into the Final Cut Pro Plugins folder before launching Final Cut Pro. These Scripts should NOT be installed when using other DV devices, unless specified. When editing to tape: On Mac OS X the sequence comes in up to 6 frames early and duplicates the first frame for up to 14 frames.
XL1	FireWire Basic	Requires FireWire Basic. When the Canon XL1 is editing to tape, it will come in up to 6 frames early, then duplicate that first frame up to 15 frames.
XL1s	FireWire Basic	Requires FireWire Basic. When the Canon XL1s is editing to tape, it will come in up to 6 frames early, then duplicate that first frame up to 15 frames.
ZR	FireWire Basic	When editing to tape: On Mac OS X, the sequence comes in up to 3 frames early and duplicates the first frame for up to 18 frames.Ê On OS 9.2.2 the sequence comes in up to 4 frames early and duplicates the first frame for up to 11 frames.
ZR10	FireWire Basic	Using Assemble Edit to print Final Cut Pro 2 projects to tapes that have been continually used and worn may contain audio drops. If you experience this problem, use a new tape. When editing to tape: On Mac OS X the sequence comes in up to 2 frames late and duplicates the first frame for up to 4 frames. On Mac OS 9.2.2 the sequence comes in up to 4 frames late and duplicates the first frame for up to 2 frames.
ZR 20	FireWire Basic	When editing to tape: On Mac OS X the sequence comes in up to 6 frames early and duplicates the first frame for up to 15 frames. On Mac OS 9.2.2 the sequence comes in up to 6 frames early and duplicates the first frame for up to 15 frames.
ZR25	FireWire Basic	When editing to tape: On Mac OS X the sequence comes in up to 6 frames early and duplicates the first frame for up to 15 frames. On Mac OS 9.2.2 the sequence comes in up to 6 frames early and duplicates the first frame for up to 15 frames.

ZR30 M	FireWire Basic	When editing to tape: On Mac OS X the sequence comes in up to 6 frames early and duplicates the first frame for up to 22 frames. On Mac OS 9.2.2 the sequence comes in up to 6 frames early and duplicates the first frame for up to 30 frames.
ZR40	FireWire Basic	For optimum performance Canon recommends that the ZR-40 not be used simultaneously with other FireWire devices. When editing to tape, the camera may come in up to 6 frames early, and duplicate the first frame of the sequence up to 12 frames.
ZR45	FireWire Basic	For optimum performance Canon recommends that the ZR-45 not be used simultaneously with other FireWire devices. When editing to tape, the camera may come in up to 6 frames early, and duplicate the first frame of the sequence up to 12 frames.

Canon Qualified DV Camcorders and VTRs

PAL

Model	Device Protocol	Description and Notes
DM-MV1	FireWire Basic	
DM-MV4i	FireWire Basic	When editing to tape: On Mac OS X the sequence comes in up to 6 frames early and duplicates the first frame for up to 13 frames. On Mac OS 9.2.2 the sequence comes in up to 6 frames early and duplicates the first frame for up to 13 frames.
DM-MV10	FireWire Basic	No Media-In by design.
DM-MV100	FireWire Basic	No Media-In by design.
DM-XL1	FireWire Basic	When editing to tape: On Mac OS X the sequence comes in up to 4 frames early and duplicates the first frame for up to 18 frames. On Mac OS 9.2.2 the sequence comes in up to 4 frames early and duplicates the first frame for up to 12 frames.
DM-XL1s	FireWire Basic	When editing to tape: On Mac OS X the sequence comes in up to 4 frames early and duplicates the first frame for up to 17 frames. On Mac OS 9.2.2 the sequence comes in up to 6 frames early and duplicates the first frame for up to 15 frames.
DM-MV3i	FireWire Basic	This camera needs the DV Tuner 2 and CMP Override Scripts to optimize device control over FireWire with Final Cut Pro 2. These are included with Final Cut Pro 2 installer and updater CDs. Once installed, locate the folder on the CD called "Extras" and you will find "DV Tuner 2" and "CMP Override". Drag these two files into the Final Cut Pro Plugins folder before launching Final Cut Pro. These Scripts should NOT be installed when using other DV devices, unless specified. When editing to tape: On Mac OS X the sequence comes in up to 2 frames early and duplicates the first frame for up to 7 frames. On Mac OS 9.2.2 the sequence comes in up on time and duplicates the first frame for up to 8 frames.
DM-MV20i	FireWire Basic	This camera needs the DV Tuner 2 and CMP Override Scripts to optimize device control over FireWire with Final Cut Pro 2. These are included with Final Cut Pro 2 installer and updater CDs. Once installed, locate the folder on the CD called "Extras" and you will find "DV Tuner 2" and "CMP Override". Drag these two files into the Final Cut Pro Plugins folder before launching Final Cut Pro. These Scripts should NOT be installed when using other DV devices, unless specified. Needs CMP Overide and Tuner 2. When editing to tape: On Mac OS X the sequence comes in up to 6 frames early and duplicates the first frame for up to 15 frames. On OS 9.2.2 the sequence comes in up to 6 frames early and duplicates the first frame for up to 15 frames.
DM-MV200i	FireWire Basic	When editing to tape: On Mac OS X the sequence comes in up to 4 frames early and duplicates the first frame for up to 24 frames. On Mac OS 9.2.2 the sequence comes in up to 4 frames early and duplicates the first frame for up to 10 frames.
DM-MV300i	FireWire Basic	This camera needs the DV Tuner 2 and CMP Override Scripts to optimize device control over FireWire with Final Cut Pro 2. These are included with Final Cut Pro 2 installer and updater CDs. Once installed, locate the folder on the CD called "Extras" and you will find "DV Tuner 2" and "CMP Override". Drag these two files into the Final Cut Pro Plugins folder before launching Final Cut Pro. These Scripts should NOT be installed when using other DV devices, unless specified. When editing to tape: On Mac OS X the sequence comes in up to 2 frames early and duplicates the first frame for up to 7 frames. On Mac OS 9.2.2 the sequence comes in on time and duplicates the first frame for up to 8 frames.

MV450i	FireWire Basic	When editing to tape: On Mac OS X the sequence comes in up to 5 frames early and can start the sequence up to 5 frames late. On Mac OS 9.2.2 the sequence comes in up to 4 frames early and duplicates the first frame for up to 20 frames.
MVX 1i	FireWire Basic	This camera occasionally dropps frames during batch capture on lower speed laptops (400 Mhz or lower). Additionally, while assemble editing on all cpus, the video consistently comes in 6 frames early. When editing to tape: On Mac OS X the sequence comes in up to 7 frames early and duplicates the first frame for up to 15 frames. On Mac OS 9.2.2 the sequence comes in up to 7 frames early and duplicates the first frame for up to 15 frames.
XM-1	FireWire Basic	This camera needs the DV Tuner 2 and CMP Override Scripts to optimize device control over FireWire with Final Cut Pro 2. These are included with Final Cut Pro 2 installer and updater CDs. Once installed, locate the folder called "Extras" and you will find "DV Tuner 2" and "CMP Override". Drag these two files into the Final Cut Pro Plugins folder before launching Final Cut Pro. These Scripts should NOT be installed when using other DV devices, unless specified. When editing to tape: On Mac OS X the sequence comes in up to 6 frames early and duplicates the first frame for up to 15 frames. On Mac OS 9.2.2 the sequence comes in up to 6 frames early and duplicates the first frame for up to 15 frames. Edit to tape not functioning with some Macintosh models.

iMovie: Tips to improve performance

- **Last Modified:** November 12, 2007
- **Article:** TA27648

- **Old Article:** 93699

Products Affected

iMovie

Try some of these tips to improve the time it takes iMovie to open, if iMovie is slow to respond to clicking or dragging, or if video or audio in the playback window is jumpy.

Install the latest software

Periodically, Apple releases updates to iMovie, QuickTime, and the Mac OS. Make sure you've installed the latest versions of this software. The Software Update feature in Mac OS X makes downloading and installing the latest updates a snap. Of course, the latest version of QuickTime is always available from the QuickTime website.

Make sure your computer meets the system requirements

Each version of iMovie has different requirements. Make sure your computer is able to take advantage of iMovie's features.

- iMovie 2
- iMovie 3
- iMovie 4
- iLife '05 and iLife '06

Only render one clip at a time

Rendering clips takes a lot of processing power. If iMovie seems unresponsive, consider waiting until a clip is finished rendering before continuing or rendering another clip. You could also render clips in small batches to improve responsiveness.

Change playback quality

If you are using iMovie 4 or later, consider changing the playback quality setting in iMovie preferences.

Note: If you are using an older computer, try turning off the option "Keep playhead centered during playback" in the playback pane of iMovie preferences by following these steps:

1. In iMovie choose iMovie>Preferences.
2. Select the playback pane.
3. Deselect the "Keep playhead centered during playback" checkbox.

Turn off Audio Waveforms

If you are using iMovie HD 5 or later, consider turning off "Show Audio Waveforms" from the View menu to free up processing power.

Don't store your project in a folder that uses FileVault

If you are using Mac OS X 10.3 or later, make sure the project you are working on isn't saved in a folder that's protected by FileVault.

Quit unused applications and users

Quit any open applications you're not using. If Fast User Switching is on, consider logging out other users.

Check the disk

Open Disk First Aid. Check the startup disk, and the disk where the project is saved.

Use Disk Utility to Repair Permissions on the startup disk.

Check for plug-ins

Check to see if there are any plug-ins in this directory: ~/Library/iMovie/. If so, remove them. Reopen iMovie and see if performance is improved. If this resolves the issue, contact the plug-in's developer for more information.

Check also for non-Apple plug-ins in /Library/QuickTime/ and ~/Library/QuickTime/ . Try moving any non-Apple items out of this folder and relaunch iMovie. Some older third party QuickTime plug-ins may interfere with iMovie operation. If this resolves the issue, check with the plug-in manufacturer to see if an update to the plug-in is available.

Copy the project to the computer's hard disk

If your project is saved on an external hard drive, try copying the project folder to the computer's hard disk (if there is room) and open it from there. See if this improves performance.

Rebuild the project

If you are only experiencing the issue in one project, consider rebuilding it.

Defragment the disk

If you have access to a disk defragmenting utility, consider defragmenting the drive where the project is located.

Project length

- If you are only experiencing the issue in one project, consider rebuilding it.
- The longer and more complicated the project, the more RAM, disk space and processor power the project may require. Try splitting lengthy projects into multiple shorter projects if you are using an older Macintosh and notice a degredation in performance with lengthy projects.
- Using other suggestions in this article (such as changing the playback quality setting) may also make a difference without having to limit your project length.

Working with HD footage

High Definition footage (HDV 720p or 1080i) requires extra CPU performance to play and edit. Make sure your computer meets the system requirements for HD editing (1 GHz G4 or faster) if you are attempting to work with HD footage.

GarageBand 1.0.1: About ReWire

- **Last Modified:** October 04, 2008
- **Article:** TA27649

- **Old Article:** 93700

Learn about the ReWire capabilities added to GarageBand 1.0.1.

Products Affected

GarageBand

The ReWire protocol is a software interface between sequencer and audio applications. Through ReWire, a host application can use a client application as an external instrument.

With version 1.0.1 and later, GarageBand acts as a ReWire host, allowing you to easily sync other third-party software that supports ReWire as a client.

Open the ReWire client application after you've opened GarageBand. The ReWire client automatically syncs to GarageBand's transport controls. The output level of the client application determines the input level of that signal in GarageBand.

When you export to iTunes the GarageBand song and the third-party ReWire client audio outputs will be bounced (merged) into a single mix.

Additional Product Support Information

Install iSight Updater 1.0.2 for best performance with iPod or other FireWire drives

- **Last Modified:** June 11, 2007
- **Article:** TA27653

- **Old Article:** 93705

For best performance in Mac OS X, install iSight Updater 1.0.2 if you also use iPod mini, or more than one FireWire drive, including an iPod.

Products Affected

iSight, iPod

iSight Updater 1.0.2 is available from Apple Downloads.

Installing this update can prevent these symptoms if you use iPod mini, or more than one FireWire drive (including other iPod models):

- There are interruptions in the video (including frame loss or "tearing").
- The video is too dark.
- iPod mini responds slowly.
- Other FireWire drives stop responding, disconnect, or slow down.

Using multi-layered Photoshop files in Final Cut Pro and Final Cut Express

- **Last Modified:** October 04, 2008
- **Article:** TA27654

- **Old Article:** 93707

Learn how to work with multi-layered Photoshop files in Final Cut Pro and Final Cut Express.

Products Affected

Final Cut Pro, Final Cut Express

Final Cut Pro and Final Cut Express treat multi-layered Photoshop files like sequences. When placed into a sequence, these clips are scaled, but the aspect ratio is not automatically adjusted. Also, additional steps are required to change the duration of imported multi-layered Photoshop files.

Multi-layered Photoshop files do not automatically adjust aspect ratio when you add them to the timeline. Also, clip duration may not be extended beyond the initial import setting.

When editing multi-layered Photoshop files into the timeline, you may need to adjust the Scale and Aspect Ratio.

1. Open the clip in the viewer.
2. Select the Motion tab.
3. To match the frame size of the sequence, adjust the Aspect Ratio under the Distort option and adjust the Scale under the Basic Motion option.

After importing a multi-layered Photoshop file the duration cannot be extended. Instead, you can adjust the duration of stills before importing the file:

1. From the **Final Cut Pro** or **Final Cut Express** menu, choose **User Preferences**.
2. Change the Still/Freeze Duration to the desired length of the clip.
3. Import the multi-layered Photoshop file.

iPod appears on the Mac OS X desktop but not in iTunes

- **Last Modified:** February 18, 2008
- **Article:** TA27658
- **Old Article:** 93718

Products Affected

iPod photo, iPod mini, iPod, iPod

This document applies to Macs. If you are using Mac OS X 10.3.4 or later, go here. If you have a PC with Windows, click here.

Make sure to use the right cable when you connect iPod or iPod mini to your Mac.

iPod models that have a dock connector may come with two cables:

- Dock Connector to FireWire cable
- Dock Connector to USB cable

Use the Dock Connector to FireWire cable to connect iPod or iPod mini to your Mac.

If you have Mac OS X 10.3.4 or later installed, you can use the Dock Connector to USB cable. With earlier Mac OS X versions, the iPod will not appear in iTunes if you use this cable.

iPod mini (Second Generation) comes with a Dock Connector to USB cable. Click here for more information.

For additional information see

300873 "iPod mini (Second Generation): Temporary delay in appearing in iTunes when large battery icon is visible"
32491 "Connecting iPod to your computer"
61937 "iTunes: iPod does not appear in Source list"

iTunes updated iPod, but where's the music?

- **Last Modified:** August 08, 2011
- **Article:** TA27659

- **Old Article:** 93719

This article has been archived and is no longer updated by Apple.

Products Affected

iPod, iPod mini, iPod nano, iPod photo, iPod, iPod (5th generation)

If iTunes updated your iPod's music library but you don't see any music, don't worry. It's all neatly organized for you just a few clicks away.

To find all the songs on your iPod, go to the main menu and select Browse. Voila. Here are all your songs neatly organized by album, artist, and so forth, just like your music library in iTunes. Select an album or artist and listen to your favorite tunes.

You can create a list of songs, called a "playlist" to organize your favorite songs. You can even have iTunes make playlists for you using the Smart Playlists feature. Once you've created a few playlists, connect iPod to your computer and iTunes will update it. Now, when you click Playlists on your iPod you'll see your favorite songs and won't have to find them by browsing through your whole music library.

Final Cut Pro and Final Cut Express: Reformat DOS-formatted hard drives before saving

- **Last Modified:** May 19, 2006
- **Article:** TA27660

- **Old Article:** 93720

Products Affected

Final Cut Express, Final Cut Pro

With earlier versions of Final Cut Pro and Final Cut Express, project files should be saved to a Mac OS Extended format hard disk.

Some hard drives are preformatted as DOS. If you try to save a Final Cut Pro or Final Cut Express project file to a DOS-formatted drive, the operation may appear to be successful, but the project file will be empty. For this reason, you should reformat these drives as Mac OS Extended format using Apple's Disk Utility software, which is available in the Utilities folder.

Warning: Reformatting or reinitializing your hard drive erases all information on your disk. Make sure you have a backup of all files you may have created and any preinstalled software that came with your drive.

To see what format your hard drive is:

1. Click the Finder icon in the Dock.
2. From the **File** menu, choose **New Finder Window**.
3. Click your hard drive icon.
4. From the **File** menu, choose **Get Info**.

Products affected

- Final Cut Pro 4.5 and earlier
- Final Cut Express HD (3.0) and earlier

iPod mini shows "OK To Disconnect" screen until you disconnect it

Products Affected

iPod

This article has been archived and is no longer updated by Apple.
iPod mini's screen says OK to Disconnect until you disconnect the cable connecting it to the computer, or remove it from the dock.

Version 1.2 of the iPod mini software features improved disconnect performance. Update your iPod mini with the iPod Updater 2004-11-15 or later available here.

Final Cut Pro 4: LiveType - Unable to open project, movie file cannot be found

- **Last Modified:** April 29, 2004
- **Article:** TA27665

- **Old Article:** 93726

A LiveType project might not open as expected if it contains a reference movie (not self-contained) that is missing one or more of its source files.

Products Affected

QuickTime, Final Cut Pro

Movie files from Final Cut Pro or from QuickTime can be either self-contained or reference movies. If a movie is self-contained, all of the video needed to play it is contained within the file itself. If the movie is a reference file, it is not self-contained. It relies on movie files stored elsewhere for playback.

An issue may arise if you add a reference movie to a LiveType project, then delete one of the source files the reference movie relies on.

This can also occur if your LiveType project includes a movie exported from Final Cut Pro that has rendered material in it, and that render data has been re-rendered, effectively deleting the original render file.

In such cases, when you open your LiveType project, you may see a message similar to this:

If you click Cancel, the alert will come back in a moment, and you will not be able to open the project.

This behavior is addressed in the LiveType 1.2 Update. Please update to LiveType 1.2.

AirPort: How to tell which AirPort software version is installed on a computer

- **Last Modified:** August 24, 2005
- **Article:** TA27673

- **Old Article:** 93738

It's easy to tell which version of AirPort client software is installed on your computer. You can find the latest AirPort software versions on the AirPort support page.

Products Affected

AirPort

Below are two different ways you can do this. Depending on where you look, the same version number may be presented two or three different ways, so please understand that "4.2", "420", and "420.8" may all refer to the same software version.

Method 1: AirPort menu

You could Option-Click the AirPort menu, then choose About AirPort.

Note: The graphic shows AirPort 4.2 versions for an AirPort Extreme-enabled computer. An AirPort-enabled computer would display slightly different versions. The highest AirPort version that you may use and the appearance of your screen will also vary between Mac OS X versions such as 10.2 and 10.4.

Method 2: Installed Updates list

The Software Update preference pane includes a list of installed updates.

1. Open System Preferences.
2. Select the Software Update pane.
3. Click the Installed Updates tab.
4. Click the Name column heading to sort by name, as shown below.

Don't use iPod as a startup disk

- **Last Modified:** March 10, 2004
- **Article:** TA27674

- **Old Article:** 93739

Though your computer might recognize iPod as a possible startup disk, Apple does not support using it as a startup disk.

Products Affected

iPod

You can store all kinds of files on iPod, even system software, but you shouldn't use iPod as a startup disk.

Uninstalling Final Cut Pro 3 in Mac OS X

- **Last Modified:** March 15, 2004
- **Article:** TA27676

- **Old Article:** 93742

Under certain circumstances you might have to uninstall Final Cut Pro. There are several files associated with Final Cut Pro that must be deleted from the computer to ensure that the software is completely removed.

Products Affected

Final Cut Pro

Tip: After completing the steps below and when Final Cut Pro has been reinstalled, the first time you open Final Cut Pro you will be prompted to enter the serial number. Make sure you have the serial number for Final Cut Pro before starting any step listed in this article.

If you have any custom settings you will want to save them prior to performing any of the steps listed below.

You will need to delete these items:

- Final Cut Pro System Support (folder)
- Final Cut Pro (application)
- Final Cut Pro User Data (folder)
- com.apple.finalcutpro.plist (file)

To uninstall, delete the following items by dragging them to the Trash. **Note**: You may prefer to access these locations via the Finder's Go to Folder feature. From the **Go** menu, choose **Go to Folder** and enter the Directory name. Before starting, quit Final Cut Pro if it is open.

Location	File/Folder to Delete
/Applications	Final Cut Pro
~/Library/Preferences *	Final Cut Pro User Data com.apple.FinalCutPro.plist
/Library/Application Support	Final Cut Pro System Support
*** Note**: The tilde "~" refers to your home directory.

Backing up Custom Settings and Window Layouts in Final Cut Pro 3

- **Last Modified:** February 16, 2011
- **Article:** TA27677

- **Old Article:** 93743

This article has been archived and is no longer updated by Apple.

You can easily back up any Custom Settings and Window Layouts you've created by following these steps.

Products Affected

Final Cut Pro

You'll want to back up these items:

- Custom Settings (folder)
- Window Layouts (folder)
  Tip: The Window Layouts folder is not created until you make a Custom Window Layout.

1. Quit Final Cut Pro if it is open.
2. Find the Custom Settings Folder and the Window Layouts folder. They are in your home directory:
   ~/Library/Preferences/Final Cut Pro User Data/Custom Settings

   Tip: The tilde "~" refers to your home directory.
3. Once you've found the folder(s) make a copy of them. Press the Option key as you drag the folder(s) to the desktop.
4. If you plan to erase your hard disk, be sure to copy these folders to another disk.
5. To use the backup copies of the folder(s), drag them back to the Final Cut Pro User Data folder (~/Library/Preferences/Final Cut Pro User Data). Remember that the folders original names are Custom Settings and Window Layouts. If the folder names have been changed in any way, correct them using the right names.

   When you drag the folders back to their original location a message will appear that says "An item named "Folder Name" already exists in this location. Do you want to replace it with the one that you're moving?" Click Replace.
6. Open Final Cut Pro and use any custom settings to make sure they are available.

Archived - Sharing your iPhoto albums through a firewall

Other people might not be able to see your shared iPhoto albums if a firewall is on.

Products Affected

iPhoto

This article has been archived and is no longer updated by Apple.
When you try to share an album from iPhoto 4 or later, this message appears:

> "Other users will not be able to access your shared photos because port 8770 is being blocked by your firewall software. Please disable the firewall for this port and restart iPhoto."

You can disable the firewall completely, or you can open the port that allows iPhoto to share while keeping the firewall active.

To open the iPhoto sharing port in firewall (8770):

1. From the **Apple** menu, choose **System Preferences**.
2. From the **View** menu, choose **Sharing**.
3. Click the Firewall tab.
4. Click the New button.
5. Choose **Other** from the **Port Name** pop-up menu.
6. Type: 8770
7. Press Tab.
8. Type: iPhoto Sharing
9. Click OK.

iPod: "iPod Software Not Installed" Message When iPod is Connected to PC

- **Last Modified:** March 18, 2004
- **Article:** TA27682

- **Old Article:** 93754

The message "An iPod has been detected, but the iPod software is not installed. Please install the iPod software from the CD that came with your iPod or download it from www.apple.com" appears on the screen of a Windows PC when you connect an iPod.

Products Affected

iPod

iTunes is not the only software you need to use an iPod. If the iPod or iPod mini is new or has been configured to be used with a Mac, you will need to do one of the following:

- Install the iPod software from the CD that came with the iPod and connect the iPod when prompted to do so by the installer.
- Download and install the correct version of the iPod Updater for your iPod and restore the iPod.

Apple Lossless compressor no longer available after upgrading to Mac OS X 10.3.3

- **Last Modified:** October 04, 2008
- **Article:** TA27684

- **Old Article:** 93757

If you install the QuickTime 6.5.1 update before the Mac OS X 10.3.3 update, the Apple Lossless codec will disappear from the list of available compressors for audio export in the QuickTime Movie Sound Settings Export Options dialog.

Products Affected

QuickTime, Mac OS X 10.3

To avoid this, install the Mac OS X 10.3.3 update before updating to QuickTime 6.5.1.

If you have updated and are missing the Apple Lossless codec, reinstall QuickTime 6.5.1 or later. It's available from the QuickTime website.

iPhoto may update picture thumbnails

- **Last Modified:** October 04, 2008
- **Article:** TA27685

- **Old Article:** 93759

When you update to iPhoto 4 or later, iPhoto may ask you to update the library's thumbnails when you open the application.

Products Affected

iPhoto

This is normal. Updating rebuilds the thumbnail files for improved quality and reliability with the newer version of iPhoto. If you choose not to update the thumbnails, you will be prompted again the next time you open iPhoto.

iPhoto libraries burned to CD or DVD are not affected by this change.

DVD Studio Pro 2: Simulator changes subtitle streams incorrectly

- **Last Modified:** March 19, 2004
- **Article:** TA27687

- **Old Article:** 93761

In the Simulator, if you change subtitle streams while playing a track, the current subtitle from the new subtitle stream appears immediately, even if it is in the middle of the subtitle text.

Products Affected

DVD Studio Pro

The proper behavior, as happens with DVD players, is for the DVD not to change subtitle streams until the current subtitle clip ends, and not to show a subtitle from the new stream until a new subtitle clip starts on that stream.

This document will be updated when additional information is available.

Archived - GarageBand: Unable to trim the start of regions created with Software Instruments

GarageBand does not allow you trim the beginning of a Software Instrument region beyond the first MIDI data event.
This article has been archived and is no longer updated by Apple.
You record a region using any of the Software Instruments in GarageBand. If you then try to "trim" the beginning of the region to coincide with the first note played, or the downbeat of the measure, you are unable to drag the left edge of the region to the first note of music. You may either be able to trim a part of the region or not to be able to trim at all.

This is because GarageBand does not allow removal of MIDI data from the beginning of a region using the trim function. The region can be resized as long as there is no MIDI data in the area before the desired starting point.

The solution is to split the region at the beginning of the note data and then delete the first segment.

DVD Studio Pro 2: Use English font name for STL import

- **Last Modified:** April 08, 2004
- **Article:** TA27692

- **Old Article:** 93773

Use the English name of a font when creating an STL file for import into DVD Studio Pro so that it will be correctly recognized.

Products Affected

DVD Studio Pro

DVD Studio Pro 2 allows you to import STL files for subtitles (see page 386 of the DVD Studio Pro 2 User's Manual). When the font names are entered in the STL file, it is important to reference them by their English names.

For instance, instead of:

$FontName =

Use:

$FontName = MS Gothic

How to remove a project and related media in Final Cut Pro 4

You can remove a Final Cut Pro project, including linked media from the hard drive.

Products Affected

Final Cut Pro

This article has been archived and is no longer updated by Apple.

Warning: This document discusses permanently deleting files from your hard disk. Following these steps will result in the permanent removal of a Final Cut Pro project and related media (even if that media is used in other projects or elsewhere). Only follow these steps once you have finished your work and if you are absolutely certain you want to permanently erase the project and associated media. Read all of the steps involved before performing any of them. These steps will not affect the Final Cut Pro application, other applications, or your Mac OS X system. Apple is not responsible for accidental loss of your media, work, or time.

A typical Final Cut Pro project is a collection of many files, including render files, captured media files, and the project file. Follow these steps to remove them from your hard disk.

Render Files

1. Open your project in Final Cut Pro.
2. From the **Tools** menu, choose **Render Manager**.
3. Click to select the checkbox in the Remove column next to the name of the project you wish to remove. **Important**: Do not select other projects or those projects' render files will be removed as well.
4. Click OK to delete the render files.

Media Files in the Browser

1. Click in the Browser window to make it active.
2. Select everything you want to delete. In many cases you will want to select everything (from the **Edit** menu, choose **Select All**). **Important**: If the Browser contains clips, images, audio or anything else that is used in another project, or is used by another application (a photo that you are also using in a DVD project, for example), do not select those items, as you will not want them to be deleted.
3. From the **Modify** menu, choose **Make Offline**.
4. Click to select the "Move Them to the Trash" button.
5. Click OK.
6. Close your Final Cut Pro project. It is not necessary to save your project at this point, as you will have to recapture all your video anyway if you chose to work on it again in the future.

The Project File
The Final Cut Pro project file is essentially a record of your edits and logging information. This file is typically small and may be archived for future use. If you captured your project's video clips using Log and Capture, you may use the project file to recapture them from tape in the future. If you do not wish to keep your project file, drag it to the Trash after you have quit Final Cut Pro.

Freeing Up Hard Disk Space

1. After performing the steps above, click the Finder icon in the Dock.
2. From the **Finder** menu, choose **Empty Trash** to delete the items that were moved into the Trash. This will permanently delete the items and will free up the hard disk space they occupied.

For more information about managing Final Cut Pro media, projects and tools, open Final Cut Pro and from the **Help** menu, choose **Final Cut Pro Help**. This help is a searchable version of the Final Cut Pro User's Manual.

GarageBand: Recovering from moved or deleted support files

- **Last Modified:** April 09, 2004
- **Article:** TA27697

- **Old Article:** 93782

GarageBand stores important information in its Application Support folder. Learn what can happen if you move or delete items in this folder and how to recover.

Products Affected

GarageBand

In most cases, you should not delete, edit, or move the folders and files inside /Library/Application Support/GarageBand. Doing so can result in the application not indexing or finding loops until it is reinstalled.

- If the "Apple Loops" or "Instrument Library" folders (or the content inside) have been removed, the software must be reinstalled.
- If the "Apple Loops Index" folder has been removed, you can create a new folder with the same name in the same location, and then reindex your loops by dragging them into GarageBand's Loop Browser.
- If only the content of the "Apple Loops Index" folder has been removed, you will need to reindex your loops by dragging them into GarageBand's Loop Browser.

Archived - iPhoto: How to create a custom constrain value

Products Affected

iPhoto

This article has been archived and is no longer updated by Apple.

Learn how to use a custom constrain value with the crop feature of iPhoto.

You can crop a picture by using a custom constrain value. Note that this constrain value is a ratio (such as 2x3), and is not a specific pixel value (such as 1024x768).

To do this in iPhoto 5 and later, choose **Custom** from the **Constrain** pop-up menu in the Edit window.

To do this in iPhoto 4 and earlier, edit your photo in a separate Edit window. Control-click on the photo and from the pop-up menu, choose **Edit in separate window**.

The toolbar of the Edit window includes fields for entering custom constrain values.

If you do not see the toolbar, check the following:

- From the **Window** menu, choose **Show Toolbar**.

If you see the toolbar, but don't see the custom constrain options, you can easily add them.

1. From the **Window** menu, choose **Customize Toolbar**.
2. Add the Custom field to the toolbar by dragging it to the toolbar.
3. Click Done.

Alternatively, you can set iPhoto to always open photos in the separate Edit window when double-clicked:

1. From the **iPhoto** menu, choose **Preferences**.
2. In the General pane, select the option **Opens photo in Edit window** from Double-click photo. In iPhoto 2, select the option **Opens in separate window**.

3. Click the close button.

When a photo is double-clicked from Organize view, it should now open in a separate Edit window within iPhoto.

Final Cut Pro: PSD files should not contain ImageReady data

- **Last Modified:** April 13, 2004
- **Article:** TA27699

- **Old Article:** 93784

Importing PSD files into Final Cut Pro may result in distorted images if the files contain ImageReady data such as animation or rollovers.

Products Affected

Final Cut Pro

PSD images with ImageReady data such as animation and rollovers will not display correctly in Final Cut Pro.

To correct these images:

1. Open the PSD file in Photoshop.
2. From the **File** menu, choose **Save As** to save a new PSD file.
3. Import the new PSD file into Final Cut Pro.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Improved volume control in iTunes 4.5

iTunes 4.5 has logarithmic volume leveling. What does this mean to you?
This article has been archived and is no longer updated by Apple.
This makes it easier to adjust the volume throughout the entire range of the slider because the volume slider behaves more like the volume knob on a stereo.

The volume slider in previous version of iTunes adjusted the volume in a linear way. But human hearing doesn't work that way. Human hearing is logarithmic, so small changes to the volume slider on one end make a big difference in the volume, while big changes to the volume slider on the other end make little change.

The maximum volume remains the same as with iTunes 4.2.

About the Digital Cinema Desktop Preview feature in Final Cut Pro HD

- **Last Modified:** July 28, 2011
- **Article:** TA27705

- **Old Article:** 93797

This article has been archived and is no longer updated by Apple.

Learn about setting up Apple Studio and Apple Cinema Displays for previewing Canvas and/or Viewer video while editing with Final Cut Pro HD.

Products Affected

Final Cut Pro, Final Cut Pro 5.X

The Digital Cinema Desktop Preview feature provides a convenient and cost effective way to play Standard Definition and High Definition video from Final Cut Pro HD. Using an Apple Studio Display or an Apple Cinema display for Digital Cinema Desktop Preview allows editors to view video playback in addition to using a traditional NTSC/PAL Broadcast monitor during the editing process.

Digital Cinema Desktop Preview Set-Up
For a full diagram of external audio and video monitoring, please refer to Chapter 7 of the "New Features in Final Cut Pro HD" document available from the Help menu in Final Cut Pro.

Although this setup works for any video format, it can be particularly useful when editing high definition video that would otherwise require a fairly expensive HD monitor. Progressive video formats such as 720p are well suited for monitoring on a computer display. If you are doing critical online editing or color correction, you may still want to use an external CRT video monitor, especially when your final output is interlaced broadcast video.

Digital Cinema Desktop Preview supports video playback for single, dual and triple monitor configurations. There are various modes for each option:

Main
The video is not scaled unless it is too large to fit on the display. If the video signal is larger than the display, it is scaled to fit on the display. Pros: The video always maintains proper aspect ratio and does not exhibit scaling artifacts due to magnification. Cons: Some formats, especially SD formats, may look very small when displayed on large computer displays.

Full-Screen
The video is scaled to fit the display in at least one dimension. If the aspect ratio of the video signal and the computer display do not match, the video on the display is letterboxed (black on top and bottom) or pillarboxed (black on sides) as necessary. Pros: This format gives you the biggest picture possible and maintains the proper aspect ratio. Cons: Scaling artifacts may be noticeable when viewed up close.

Raw (1:1)
This mode shows the video data with as little processing as possible. This can be useful for engineering evaluations of the image. No scaling is done whatsoever. Pros: More accurate assessments of video quality can be made. Cons: Not useful for general viewing. No scaling or pixel aspect ratio adjustments are made, even when the video is larger than the display. For example, a 720p frame (1280 x 720) showing in raw mode on an 800 x 600 display only shows 800 x 600 of the image.

To view Final Cut Pro video output on a computer display connected to your computer

1. From the **Final Cut Pro** menu, choose **A/V Settings**.
2. Click the A/V Devices tab.
3. Choose one of the display options from the **Playback Output Video** pop-up menu.

Digital Cinema Desktop Preview for Presenting Full-screen Video Monitoring on the Main Computer Display
In addition to viewing Canvas or Viewer video on a second computer display connected to your computer, you can now present video on the main display. A third monitor may also be connected to better view the information contained in the Browser window. The main computer display is the display that normally shows the menu bar for applications. This feature is particularly useful for systems with a single computer display (such as PowerBooks and high definition video editing systems with a single Cinema Display).

Regardless of how many monitors you have connected, you can always choose to monitor on the main display. Video presented on the main display is always shown in full-screen mode. In full-screen mode, the video is scaled to fit the display in at least one dimension. If the aspect ratio of the video signal and the computer display do not match, the video on the display is letterboxed (black on top and bottom) or pillarboxed (black on sides) as necessary. This is identical to full-screen mode on a second monitor. For more information about monitoring on a computer display, see New Features in Final Cut Pro HD 4.5.

To view Final Cut Pro video output on the main computer display connected to your computer:

1. From the **Final Cut Pro** menu, choose **A/V Settings**.
2. Click the A/V Devices tab.
3. From the **Playback Output Video** pop-up menu, choose **Desktop Cinema Display - Full Screen [Main]**.
4. From the **View** menu, choose **External** and then choose **All Frames** from the submenu, or press Command-F12.

Supported Formats

- DV100 (DVC Pro HD)
- DV50 (NTSC PAL)
- DV25 (NTSC PAL)
- Offline RT (Photo JPEG)
- Apple Uncompressed (8-bit, 10-bit)

Tips for Using Digital Cinema Preview
Regular editing commands still work when full-screen video is presented on the main display. This means you can still mark In and Out points, use JKL-playback, and so on. For a list of shortcut keys: From the **Tools** menu, choose **Keyboard Layout** and then choose **Customize** from the submenu, or see the Final Cut Pro 4 Quick Reference Card.

Command-F12 is the default shortcut key for turning external video monitoring on and off. When full-screen video is presented on the main display, the menu bar cannot be seen, so it is important to learn the shortcut key.

To turn off full-screen video presented on the main display:
Press Command-F12 or press the Escape key.

Directly monitoring video on a computer display does not introduce video latency. Therefore, Final Cut Pro ignores the frame delay offset setting when you monitor your video on a computer display (as opposed to an output that has inherent video latency, such as FireWire DV or a third-party video card).

Due to the refresh rate of LCD computer monitors, 1080i 60 and 720p 60 material may exhibit some temporal artifacts during playback.

Video playback to a traditional CRT NTSC or PAL monitor differs from playback to LCD Cinema Display. CRT monitors scan entire fields of pixels to create a frame's worth of lines. LCD Cinema displays, use phosphors rather than pixels and scan entire frames at one time. Therefore LCD Cinema Displays have a longer "decay" period between each frame when compared to lines being scanned on a CRT. At times, the same video image will be visible on screen for a period of up to four to seven frames.

Interlaced material is being scanned at the frame rate versus field rate thus when viewing 1080i 60 and 720 p 60 both fields are being drawn simultaneously which may result in visual interlacing.

Computer Displays operate in RGB color space versus YUV color space (used by a NTSC/PAL Broadcast monitor) therefore, some effects may appear differently between output to tape and what was previewed on the computer display.

Monitor resolution must be adjusted prior to launching Final Cut Pro HD.

Turning on may restrict the number of RT effects available in timeline (however their RT status will not change in the Effects menu/Effects folder in Browser)

Currently third-party video capture cards and their accompanying codecs are not compatible with Digital Cinema Desktop Preview feature.

Refrain from clicking on the monitor upon initially enabling Digital Cinema Desktop Preview (especially in Single User mode).

Exposé is not supported with Digital Cinema Desktop Preview.

Graphics files 1920x1200 and larger will not always display properly.

Digital Cinema Desktop Preview must be disabled when performing ETT and P2V.

The screen saver needs to be shut off for the computer monitor being used for Digital Cinema Desktop Preview.

Archived - Sharing large music libraries doesn't work in iTunes 4.5

With iTunes 4.5, you probably won't be able to listen to someone else's shared music (also using iTunes 4.5) if the library is too large. You'll see the "Loading <shared music name>" message in iTunes stays, but the shared library won't appear.

Products Affected

iTunes

This article has been archived and is no longer updated by Apple.
Update to the latest version of iTunes to prevent this from occurring.

With iTunes 4.5, the solution is to ask your friend to create a playlist in iTunes that contains a smaller subset of her music, and share it instead.

Archived - Pictures look blurry in iPhoto

iPhoto 2 or later can smooth the appearance of a photo that's not viewed at 100 percent. In some cases a smoothed picture may appear "blurry" if you view it at less than 100 percent.
This article has been archived and is no longer updated by Apple.
If this happens, don't worry. It won't affect your print or book orders or printouts on your printer. For the display appearance you try one or more of these steps:

- In Organize view, try adjusting the zoom slider to a larger or smaller view.
- In Edit view, resize the iPhoto window to a larger size, if possible. Alternatively, try configuring iPhoto to edit photos in a separate window or follow these steps to view a photo in a separate window:
  1. Control-click the photo and select "Edit in separate window" option from the shortcut menu.
  2. Zoom to 100 percent by clicking the zoom buttons in the toolbar of the separate window. (The current zoom level is displayed in the title bar of the window.)

- Consider setting iPhoto preference to view photos in another application when you double-click them. **Note**: Preview may have similar issues when the picture is not viewed at 100 percent.

Final Cut Pro HD: DCD video is distorted with some formats

- **Last Modified:** May 10, 2004
- **Article:** TA27710

- **Old Article:** 93808

When using certain video formats, output using the Digital Cinema Desktop feature appears distorted, with tints of pink, blue, or green.

Products Affected

Final Cut Pro

This can happen in Final Cut Pro HD (4.5) when using OfflineRT at a quality higher than 35%, or MJPEG formats with third-party video cards.

If you're using Apple's OfflineRT format, the solution is to set the quality to 35% in the General tab of the Sequence Settings window.

This document will be updated as more information becomes available.

Final Cut Pro 4 won't quit when DCD is selected

- **Last Modified:** May 12, 2004
- **Article:** TA27711

- **Old Article:** 93809

You might not be able to quit Final Cut Pro 4 if Final Cut Pro HD is also installed on the computer and you've chosen to use Digital Cinema Desktop in the Audio/Video Settings window.

Products Affected

Final Cut Pro

If you try to quit when there are unsaved changes in your project, a warning dialog appears, but you cannot click any of the buttons and must force quit Final Cut Pro.

Digital Cinema Desktop is installed by and works with Final Cut Pro HD. Even though it can appear as an option in Final Cut Pro 4, it will not work and should not be used.

To return the program to its normal state, follow these steps:

1. Open Final Cut Pro.
2. From the **Final Cut Pro** menu, choose **Audio/Video Settings**.
3. In the General tab, set Video Playback to None.

Final Cut Pro HD: Do not capture DV100 footage with mixed frame rates

When capturing DV100 video (such as DVCPRO HD) in Final Cut Pro HD, be sure that the clip you are capturing uses a consistent frame rate.

Products Affected

Final Cut Pro

This article has been archived and is no longer updated by Apple.

Capturing DV100 clips with different frame rates results in a captured clip that Final Cut Pro HD interprets as having the frame rate of the footage on the tape when the capture began. For example, you may have a tape with camera-generated bars and tone at 720p60 followed by footage shot at 720p24. Even though the majority of the footage is 720p24, the clip will be recognized as 720p60. This will happen even if the first few frames of the tape are different from the rest.

Instead, be sure to capture DV100 clips with only one frame rate. You can capture other parts of the tape separately and render them into your sequence if necessary.

Note: This information does not apply to variable frame rate footage taken with a VFR-capable camera. In these cases, you can use a hardware or software frame rate converter to convert the media to other formats.

Checking for iDVD chapters using QuickTime Player

- **Last Modified:** May 20, 2004
- **Article:** TA27720

- **Old Article:** 93824

iDVD lets you import a movie from Final Cut Pro or Final Cut Express with chapter markers. The result of this is that a Scene Selection menu is created in iDVD so that you can select a chapter and jump directly to it.

Products Affected

Final Cut Express, iDVD, Final Cut Pro

If you've exported a movie with chapter markers from Final Cut Pro or Final Cut Express, but don't see any chapters (or a Scene Selection menu) in iDVD, you can check the file you exported in QuickTime Player. To see if the movie has any chapter markers, open it in QuickTime Player and look in the lower right corner, as seen here.

You should see a small pop-up menu showing the chapter names. If you don't see the chapter names here, iDVD won't be able to make chapters.

LiveType's Media Browser window won't open

- **Last Modified:** October 04, 2008
- **Article:** TA27721

- **Old Article:** 93825

LiveType's Media Browser window may not open if malformed or damaged fonts are installed.

Products Affected

Final Cut Pro

When LiveType opens, it reviews the fonts installed on your computer. If LiveType encounters fonts that are malformed or have file issues, the LiveType Media Browser window might not open.

You can use Mac OS X's Font Book application to examine the fonts installed on your computer. Font Book is located in the Applications folder. Open it and check to see if there are any fonts that have question marks in place of a correct name, as seen here:

The solution is to update to Mac OS X 10.3.5. This update is available in Software Update in System Preferences and can also be downloaded from here.

If you're not ready or able to update, you can remove the font to keep it from interfering with LiveType. To do this, select the font as seen above, then choose **Remove Font** from the **File** menu.

If you have downloaded a font but not yet installed it, and you want to make sure it will be OK it before you install it, follow these steps:

1. Locate the font on your Desktop (or wherever you saved it). It will look something like this:

2. Double-click the file. Font Book opens the font and shows a preview. In the images below, you can see that the malformed or damaged font (on the top) shows question marks for its font name and family name. This font file will likely cause issues if installed:

   This image is an example of a font that will not cause the symptom described above:

iTunes 4.5 unexpectedly quits when accessing some Internet radio streams

- **Last Modified:** June 09, 2004
- **Article:** TA27725

- **Old Article:** 93831

If the Web address (or "URL") of an Internet radio stream does not start with "http://", iTunes 4.5 unexpectedly quits when it opens the stream.

Products Affected

iTunes

An affected stream may have worked with iTunes 4.2. This can happen with iTunes 4.5 for Mac OS X and for Windows.

Update to iTunes 4.6 to prevent this from occurring.

Final Cut Pro HD 4.5: How to delete the preference files

- **Last Modified:** June 07, 2004
- **Article:** TA27726

- **Old Article:** 93832

Learn how to resolve issues caused by unusable preference files in Final Cut Pro HD.

Products Affected

Final Cut Pro

When troubleshooting Final Cut Pro HD, one step you can take is to delete the Final Cut Pro preference files. Doing this restores Final Cut Pro HD to the default settings and behavior. These files contains user preferences for scratch disk settings, capture settings, window layouts, and so forth.

To delete the Final Cut Pro HD preferences files, do the following:

1. Quit Final Cut Pro HD.
2. Click the Finder icon in the Dock.
3. From the **Go** menu, choose **Go to Folder**.
4. Type: `~/Library/Preferences/` **Note**: The tilde "~" refers to your home directory. For more information see "Mac OS X: Using Your Home Directory".
5. Click Go.
6. Drag the file named "com.apple.FinalCutPro.plist" to the Trash.
7. Double-click the folder named "Final Cut Pro User Data".
8. Drag the file named "Final Cut Pro 4.5 Preferences" to the Trash.
9. Drag the file named "Final Cut Pro POA Cache" to the Trash.
10. Open Final Cut Pro HD.

Important: Do not delete any of the other files in the Final Cut Pro User Data folder.

Once this process is completed Final Cut Pro HD reverts to its installed defaults. Reset all of your desired application preferences to match what they were before--in particular your Scratch Disk Preferences, keyboard mappings, and the selected Sequence Settings.

Back up configured preference files

To avoid recreating all your custom settings in the event you have to delete the preference files again, follow these steps to save a clean copy of the file:

1. Make a backup copy of the "Final Cut Pro 4.5 Preferences" and the "com.apple.FinalCutPro.plist" files immediately after it is configured for the first time.
2. Put the backup copy of the files in a safe place.

If you have to delete the preference files again, you can simply replace them with the backup copy of the saved, clean files. This preserves your desired preference settings, while eliminating any unwanted behaviors that may have been caused by a faulty Final Cut Pro preferences file.

Note: It is not necessary to back up the Final Cut Pro POA Cache file.

Finding the DVD Studio Pro registration number

- **Last Modified:** October 04, 2008
- **Article:** TA27730

- **Old Article:** 93838

The 11-digit registration number for DVD Studio Pro is located on the front page of the booklet titled "Installing Your Software", as shown here.

Products Affected

DVD Studio Pro

You use this number to register your professional software product with Apple via the Internet. This number is required when you call AppleCare Technical Support.

Important: The registration number is different from the software serial number you use to activate and serialize your professional software product. Both the registration number and software serial numbers are important. Keep them in a safe place for future reference.

DVD Studio Pro includes 90 days of free telephone support, which includes help installing and opening your Apple Professional Software Product, and with basic troubleshooting.

Note: In the United States, Canada, Europe and Japan, Apple products come with 90 days of free telephone support. In other countries, availability of support, duration of the complimentary support period, telephone numbers, and hours of operation may vary and are subject to change. Telephone call charges may apply.

Finding the Final Cut Pro 4 registration number and the serial number

The 11-digit registration number for Final Cut Pro 4 and Final Cut Pro HD 4.5 is located on the front page of the booklet titled "Installing Your Software", as shown here.

Products Affected

Final Cut Pro

This article has been archived and is no longer updated by Apple.

You use this number to register your professional software product with Apple via the Internet. This number is required when you call AppleCare Technical Support.

The serial number is printed on the same page of the Installing Your Software guide below the registration number. This is a 28 digit combination of numbers and letters in this format:
X-NNN-XXX-NNN-XXX-NNN-XXX-NNN-XXX-NNN

If your serial number isn't being accepted by the program, take note of the following and try again:

- Make sure you are reading from the original serial number label that came with the product.
- Enter your first and last name, and verify there are no mistakes in the serial number field.
- Make sure you enter a zero and not an O, a 1 and not a lowercase L, where appropriate
- The dashes in the serial number are required.
- Make sure there are no spaces before or after the serial number.
- If you purchased an upgrade version of Final Cut Pro, you may also be asked to enter the serial number for your previous version of Final Cut Pro.
- There is also a 20-digit serial number for QuickTime Pro included with Final Cut Pro. Make sure you are using the correct serial number. Click here for help entering the QuickTime Pro serial number.

Important: The registration number is different from the software serial number you use to activate and serialize your professional software product. Both the registration number and software serial numbers are important. Keep them in a safe place for future reference.

Final Cut Pro includes 90 days of free telephone support, which includes help installing and opening your Apple Professional Software Product, and with basic troubleshooting.

Note: In the United States, Canada, Europe and Japan, Apple products come with 90 days of free telephone support. In other countries, availability of support, duration of the complimentary support period, telephone numbers, and hours of operation may vary and are subject to change. Local telephone call charges may apply.

Maximum memory usage in Final Cut Pro is 2.5 GB

- **Last Modified:** February 06, 2009
- **Article:** TA27734

- **Old Article:** 93844

Products Affected

Final Cut Pro 5.X, Final Cut Studio, Final Cut Pro, Final Cut Pro 6.x

On a computer with more than 4 GB of RAM installed, you may notice that Final Cut Pro allows a maximum memory allocation of 2.5 GB.

This is what you'll see in the Memory & Cache tab of the System Settings window:

Why can't Final Cut Pro use more than 4 GB of RAM?

Mac OS X is, at present, a 32-bit addressable operating system. This means that any single program running on the computer can take at most 2^32 bytes, or 4 GB, of memory. Final Cut Pro is subject to this ceiling just as any other program would be and is restricted to allocating no more than a total of 4 GB of RAM.

Why can't I allocate more than 2.5 GB of RAM to Final Cut Pro?

The memory available for allocating in the Memory & Cache tab of the System Settings window includes memory directly used by Final Cut Pro, but the program loads many other frameworks, libraries, and drivers, which may also allocate memory. Although this memory isn't directly allocated by the program itself, the allocation still falls into Final Cut Pro's address space and contributes to the 4 GB limit. Final Cut Pro reserves 1.5 GB of RAM for these frameworks, libraries, and drivers and so only allows a maximum of 2.5 GB to be allocated by the user.

Archived - Multisession burn option not available in all applications

With Mac OS X 10.3 and later, you can use Disk Utility to burn appendable or "multisession" CD-R discs. For help using this feature, see "Recording on a CD-R disc more than once."

Products Affected

Mac OS X 10.3, Mac OS X 10.4, iPhoto

This article has been archived and is no longer updated by Apple.

Other applications that can burn discs (such as iPhoto) don't yet use this feature, even if it appears, albeit dimmed, in their interfaces.

Upgrading to QuickTime Pro

- **Last Modified:** May 29, 2007
- **Article:** TA27738

- **Old Article:** 93858

When you purchase QuickTime Pro from the Apple Store, a Web order number and an activation key appear on the order confirmation webpage. They are also included in the confirmation email sent to you after your purchase.

Products Affected

QuickTime

Please print both of these, if possible. They are your only reference to the key if data on your computer is lost for any reason.

A QuickTime 6 Pro key activates the pro features in QuickTime 6.0 or later. If you have an earlier version of QuickTime, you will need to download the current version of QuickTime and use a QuickTime 6 Pro key to access QuickTime 6 Pro features.

Tip: The key activates features that have already been installed. There is no QuickTime Pro CD to wait for or additional software to download with this purchase.

If you need QuickTime 6, a free download is available from the QuickTime download page.

Final Cut Pro HD: Modifying timecode on the current frame

- **Last Modified:** June 14, 2004
- **Article:** TA27739

- **Old Article:** 93863

Learn about an issue with modifying the timecode of the clip's current frame.

Products Affected

Final Cut Pro

Symptom

After modifying the timecode of a clip with the "Frame To Set" pop-up menu set to "Current," the timecode of the clip's current frame changes to an unexpected value.

Products affected

- Final Cut Pro HD 4.5

Solution

1. Calculate what the new start timecode would be for the clip.
2. Use Modify Timecode for the first frame instead of the current frame.

This document will be updated as more information becomes available.

Visit the Apple Store online (1-800-MY-APPLE), visit a retail location, or find a reseller.

Copying large files to an iPod formatted for Windows

- **Last Modified:** August 24, 2004
- **Article:** TA27741

- **Old Article:** 93866

If your iPod's hard disk is formatted to work with Windows, the size of largest file you can copy to it is 4 gigabytes (GB). If you try to copy a larger file, it won't work.

Products Affected

iPod

This is because the FAT32 file system--the Windows hard disk format used for iPod--limits files to 4 GB. This limitation does not apply to an iPod formatted for Mac, which uses the Mac OS Extended (HFS Plus) file system. Its file size limit is much larger, in case you were wondering.

If you're just trying to copy a file to iPod, try using some compression software to make the file size smaller than 4 GB.

If you have a song that's larger than 4 GB, here are a couple to things you can do:

- Convert the song to a compressed format (AAC, MP3) so that it is less than 4 GB in size.
- Reimport the song from the original source in smaller pieces (by tracks).

You can read more about the FAT32 file system in the Microsoft Knowledge Base.

ARCHIVE

Connecting SCSI devices to your Mac

- **Last Modified:** October 04, 2008
- **Article:** TA27743

- **Old Article:** 9387

This article has been archived and is no longer updated by Apple.
SCSI (pronounced SKUH-zee) stands for Small Computer System Interface. It is a standard method for connecting computers and peripheral devices like hard disk drives, CD-ROM drives, printers, and scanners. SCSI ports, cables, and terminators are usually labeled with the SCSI icon which looks like a diamond-shaped G.

This article covers the following topics:

Overview
The Connection
Basic Vocabulary
SCSI Termination
Terminator Types

The SCSI Chain
Making The SCSI Chain Work
Setting Up A SCSI Chain
Connecting SCSI Cables
Terminating The SCSI Chain
Hints And Help

PowerBook Requirements

Apple Cable Part Numbers

Where To Get More Information

Overview

The Connection

Most storage devices, such as hard drives, CD-ROM drives, and scanners are connected to the Macintosh using SCSI. The 25-pin port is located on the back of your desktop Macintosh. You can recognize the SCSI port by the diamond-shaped SCSI icon above it. (On PowerBook models the port is a 30-pin square connector.) Peripheral devices typically have a 50-pin Centronics connector on them (it is longer and wider than the SCSI port on your Macintosh).

Your Macintosh can have a total of seven SCSI devices connected to it (the Workgroup Server 95 can have up to 20 devices). If you have System 7.5 and use the SCSI Manager 4.3, you can have up to 14 SCSI devices, 7 per bus on the Quadra 900 and 950 and the Power Macintosh 8100/8150/9150. Internal hard drives, internal CD-ROM drives, and other internal storage devices are included in this limit of seven

devices. This does not include floppy drives, which are not SCSI devices.

Basic Vocabulary

SCSI bus The electronic path on which data travels.

SCSI device A computer or peripheral that can communicate on a SCSI bus. A SCSI device can be internal (such as an internal hard drive) or external (such as an external hard drive, printer, CD-ROM drive, or scanner).

SCSI chain A series of SCSI devices connected by SCSI cables. A SCSI chain can have up to seven SCSI devices.

SCSI ID number A number from 0-7 used by the computer to identify and distinguish between SCSI devices. The SCSI ID identifies each device no matter where it is physically connected in the SCSI chain. The SCSI ID number also determines which one goes first when devices compete for the use of the SCSI bus. The higher the number, the higher the priority on the SCSI bus. Though since the Macintosh is the only device "competing" for the bus, the ID number as a priority is basically irrelevant.

SCSI terminator A piece of hardware that acts as a resistor to reduce interference along the SCSI bus. SCSI devices chained together form an electronic signal path. At the end of the path, signals tend to "bounce" back up the SCSI path and cause interference. This interference can cause difficulties with your Macintosh and/or one or more of your SCSI devices.

SCSI Termination

The most important thing to understand about using SCSI devices is proper termination. SCSI devices chained together form an electronic signal path. At the end of the path, signals tend to bounce back up the SCSI path and cause interference. This interference can cause difficulties with your Macintosh and/or one or more of your SCSI devices.

Terminating a SCSI bus preserves high transmission speeds, and if the terminator is properly placed, cleans up the signal along the entire length of the line. Terminators also provide a reasonable degree of electrical noise immunity. The most important reason to terminate a SCSI bus is that termination is required for the bus to work! A bad signal anywhere on the chain can cause all of the SCSI devices, in some cases the Macintosh itself, not to function properly.

Terminator Types

Physically, terminators generally take three forms. Electrically, these types of terminators are equivalent and vary only in where and how they are installed.

On-Device Terminators

These are known as resistor packs (or sips or dips). You only remove them to add a second drive or to add a drive to a system where the main logic board is terminated. They reside on the SCSI device itself and are almost always removable. Always note the orientation of the resistor packs before attempting to remove them! They are polarized and must not be inserted backwards. Some newer drives have resistors permanently mounted on the drive. On these drives, there is a jumper to enable or disable termination.

External Terminator Blocks or Plugs

These are short plug-like devices and are inserted between an external hard drive's SCSI connector and the SCSI cable, or on the second connector if one exists. Don't confuse these with the ON-DRIVE terminators. ON-DRIVE literally means on the drive mechanism -- not on the external connector. Never use the external terminator when the drive inside a cabinet has terminators installed on it.

Main logic board terminators

These may look like a SIMM or a narrow plug. They are used only when there is no internal hard drive in the Macintosh. Main logic board terminators are inserted into the 50 pin SCSI connector on the Macintosh main logic board where the cable for an internal drive would normally connect. These main logic board terminators are keyed (a polarity notch) and must never be inserted backwards!

The Quadra 800/900/950 have a terminator on the internal drive cable itself. This means that internal SCSI devices should not be terminated.

Switched Termination

Some SCSI peripheral vendors also use switched termination. This means they have a type of switch that controls whether or not the device is terminated. The terminator is actually one of the first two types mentioned, but is controlled electronically with a switch.

The SCSI Chain

Making The SCSI Chain Work

There are several key points you need to keep in mind to make sure that all of your SCSI devices work correctly:

Keep connected SCSI devices powered while your Macintosh is on

Even if you do not plan to use a device, you still must power it on. This ensures a proper SCSI signal path. It is okay to power the devices on at the same time as your Macintosh, but some devices need to be powered on before your Macintosh, consult the manual that came with your SCSI device.

Only terminate the first and the last device
In most cases, only the first and last SCSI device should be terminated. If the Macintosh has no internal hard disk drive (or other SCSI device) installed, then a main logic board terminator should be installed. Macintosh computers sold without internal hard drives include this terminator, and many third party hard drive vendors sell them if you need one. If there is not an internal SCSI device, and if there is not an internal terminator present, then the first external device should be terminated.

There are a few exceptions. If the bus is short (generally 18 inches or less) then it is best to terminate just one end. Also, if the total cable length between all devices is greater than 10 feet, the cable might need to be terminated at the 10 foot point in addition to each end. When daisy chaining three or more SCSI devices, the total bus length often exceeds the 10 foot specification and may require three terminators in the chain to work properly. Do not add the third terminator unless you are having difficulties and you have checked all other possible causes.

Never terminate the same device twice
Some devices which supply termination power (TERMPWR) to the SCSI bus can cause difficulties if they are used on the internal bus of the Power Macintosh 8100/8150/9150. Any drives attached to this bus should be configured with TERMPWR disabled, regardless of whether they are terminated or not.

Only use a black terminator where specified
The black terminator should only be used when a Macintosh IIfx is the host Macintosh and for connecting hard drives to the LaserWriter IIf/IIg and the LaserWriter Pro 630. This black terminator differs (electrically) only slightly from the gray terminator; it does not differ physically other than color. Its purpose is to compensate for some changes in the SCSI chip used in these devices.

Always use high quality cables
Use cables that are double-shielded (foil and braid), such as Apple SCSI cables. Never use simple printer type RS232 cables, which are commonly used with DOS/Windows printers. Make sure the connector hoods (or shrouds) are each connected to the shield braid. Poor quality cables are often the case of seemingly mysterious SCSI difficulties.

Keep total length of all cables used under 20 feet
A longer SCSI chain is susceptible to interference and possible data loss or corruption. Keeping the length under 20 feet maximizes signal integrity.

Keep cables between devices as short as possible.
Generally 18 to 24 inches is best, but never exceed 6 feet or you will most likely have difficulties. PowerBook computers, some scanners, and possibly other devices refuse to work with cables over 24 inches in length.

Avoid mixing brands, types, or styles of cables
Each cable has a different type of construction, impedance, and wire placement, which can result in bus reflections. In mixed cable configurations some devices may simply not work even if all other guidelines are followed.

Check all SCSI devices have a unique SCSI ID number
A number from 0-6 is used by the Macintosh to identify and distinguish between SCSI devices. The number 7 is always reserved for the Macintosh itself. Other devices include a factory set default, as this table indicates:

Common SCSI ID Number Assignments

SCSI ID	Device
0	Commonly used for an internal hard drive, if present
3	External Apple CD-ROM drives (see note)
3	Internal Apple CD-ROM drives (see note)
5	Apple scanners
7	Reserved for the Macintosh
8 and 9	Always invalid number selections but may appear as options on some third-party devices

Note: If two devices have the same ID number, one or both may not start up, or they may damage files if they try to send data at the same time. Device manufacturers use many ways to set the SCSI ID number, including thimble, push switch, DIP switches, jumpers, and software. Check each device's documentation to see how to set its ID.

Power off all devices prior to changing SCSI chain configuration
Always turn off the Macintosh and all peripherals before attaching or detaching any cables or devices or changing SCSI ID numbers. Doing otherwise could cause permanent physical damage to your computer or SCSI devices as well as the loss of important data. Attach the proper cables to their devices. Use the thumbscrews and metal clamps on the cables to maintain a tight, reliable connection. Do not over-tighten.

Use the same driver software for all storage devices
If you have several storage devices from different vendors, you may encounter driver-level conflicts. Since device drivers load into memory when the Macintosh is turned on, they can generate conflicts similar to INIT or extension conflicts. To eliminate these conflicts, you should reformat all of your SCSI storage devices with the same formatting software. Apple's formatting software, Apple HD SC Setup, only works with devices sold by Apple, so this isn't usually an option. However, there are several third parties that make "universal" formatters (such as Drive 7, Hard Disk Tool Kit, and Silverlining) that format most of the storage devices available for the Macintosh.

SCSI Manager 4.3
SCSI Manager 4.3 adds several new features to the SCSI architecture of the Macintosh. These features include SCSI 2 compliance, concurrent asynchronous I/O, and disconnect and reconnect. These new features can improve the performance of the SCSI bus. SCSI Manager 4.3 is supported on all Power Macintosh, and 68040 Macintosh computers, except for the Macintosh 630 family and 68040 PowerBook.

SCSI Manager 4.3 is part of the ROM in all Power Macintosh and Quadra AV computers. Other 68040 Macintosh computers require the SCSI Manager 4.3 system extension.

Use a bootable floppy or CD for testing
Since System file corruption and extension conflicts can cloud the troubleshooting process, it is a good idea to make a bootable floppy to test SCSI difficulties. Configure the start-up disk with minimal drivers and extensions. The CD which came with your computer is also a good tool for troubleshooting.

Check the drive with a utility
Use Apple Disk First Aid or another utility to verify the integrity of a SCSI storage device. You will likely have to start your Macintosh from a different drive than the one you are checking to repair it if difficulties are encountered. The Disk Tools or Utilities floppy disk or startup CD that you received with your Macintosh can be used.

When troubleshooting, isolate devices
If you have followed all the rules without success, start to isolate devices. See if each one individually works correctly. If it does, then start to build the SCSI chain one device at a time. There may be a specific bad device, cable, terminator, connector, or software driver causing the difficulty.

Reformat the storage device
Corrupt drivers cannot usually be detected by diagnostic utilities. If you are unable to get a particular device to work by itself, reinstalling the driver (Update in Apple HD SC Setup) will often help. In rare cases you may wish to consider reformatting to be sure the driver is good.

Setting Up A SCSI Chain

Setting up a chain of SCSI devices consists of:

- Setting SCSI ID numbers (also called SCSI addresses).
- Connecting SCSI cables.
- Terminating the SCSI chain.

The first task, setting SCSI ID numbers takes three steps:

1. Make sure your Macintosh and all SCSI devices are powered OFF. SCSI IDs should never be changed with the devices on.
2. Check all SCSI devices on the SCSI chain to make sure that each has a unique SCSI ID number. (The Macintosh is always 7, so that it has the highest priority; an internal hard drive, if present, is usually 0.) Do not set duplicate numbers. If two devices have the same ID number, one or both may not start up, or they may damage files if they try to send data at the same time.
3. Reset the SCSI ID numbers if necessary. There are four methods that device manufacturers use to set the SCSI ID number: thumb wheel, switch, DIP switches, or software.

Connecting SCSI Cables

There are three types of SCSI cables:

- System cable (Macintosh to SCSI device)
- Peripheral interface cable (SCSI device to SCSI device)
- Cable extender (extends the SCSI cable length)

Follow these steps to connect your SCSI cables:

1. Identify your cables before beginning.
2. Turn off the computer and all peripherals before attaching cables and/or devices.
3. Attach the proper cables to their devices. Use no more than 20 feet of cable; otherwise, SCSI signals deteriorate, causing unreliable

operation. Use the metal clamps and thumbscrews on the cables to maintain a tight, reliable connection. Do not over tighten.

Terminating The SCSI Chain
Improper termination can cause damage to SCSI circuits inside your Macintosh, corrupt files, keep your Macintosh from starting up, and/or cause intermittent failures.

Choose the correct terminator type
Terminators are of two colors: gray and black. Use the gray one when any Macintosh except the Macintosh IIfx is used. Use the black one when a Macintosh IIfx is used.

The black terminator is also used when connecting a hard drive to some Apple LaserWriter printers. Consult your printer manual to verify which terminator you should use. Currently only the LaserWriter IIf/IIg and the LaserWriter Pro 630 require the black terminator.

Turn off the computer and all peripherals before changing terminators
The risk of damaging either the peripheral or the host computer is quite high if termination is changed while either device is powered on.

The Macintosh has an internal hard drive
If the Macintosh in the SCSI chain DOES have an internal hard drive, terminate only the other end of the SCSI chain. (All Apple internal SCSI hard drives have built-in terminators).

The Macintosh does not have an internal hard drive
If a Macintosh in the SCSI chain DOES NOT have an internal hard drive and DOES NOT have a terminator on the internal ribbon cable or on the logic board, terminate both ends of the SCSI chain.

Peripheral SCSI Chain Needs Its Own Termination
If you have a hard drive connected to a printer (to store fonts for example) which is connected to your Macintosh computer through LocalTalk or some other network connection, that hard drive is on a separate chain from the SCSI port on your Macintosh computer. Therefore, the hard drive connected to your printer must have its own termination. The terminator on your Macintosh computer's SCSI chain will not terminate this completely separate chain.

The Macintosh has a third party SCSI device
If you have a third-party (non-Apple) SCSI device, check the manual to find out if it is internally terminated. If the device is not internally terminated, follow the directions in the 2nd, 3rd, and 4th items directly above under the section "Terminating the SCSI Chain."

If the SCSI device is internally terminated, you have two choices:

- Put the device at the end of the SCSI chain
- Remove the termination from the device

(Check the device's manual to find out if termination can be removed, and if so, how it is done.)

Hints and Help

Set Higher Priorities to Startup Devices
In general, assign the higher priorities to startup devices. For example, an external hard drive that is used as the startup disk should be set to number 6 or 5.

Set Lower Priorities to Seldom Used Devices
After assigning priorities to startup devices, set other ID numbers according to how often they are used. For example, a tape backup that is only used occasionally should be set to a lower numbers, such as 2 or 1.

Use Factory Settings as a Guideline
Use the factory settings as a guideline for setting SCSI ID number priorities. For example, if you have a SCSI device that has an ID number of 1, but you already have a device using this number, set it to another low number, such as 2 or 3.

PowerBook Requirements
All the preceding rules apply to PowerBook computers. In addition, some PowerBook computers may require special attention. Consider these points:

All PowerBook models manufactured from the 3400 series to current provide internal termination
These include the following PowerBook Models: 3400, 2400, PowerBook G3, and PowerBook G3 Series. Because previous PowerBook models are not internally terminated they require a pass-through terminator between the HDI-30 SCSI System Cable and the first SCSI device, and another terminator at the end of the SCSI chain. However, depending on the device, you may or may not need a terminator. This depends on

whether the device supplies termination power or not.

PowerBook computers do not supply termination power
Using a terminator may keep the PowerBook from either booting, or seeing the external SCSI device. Depending on the device, you may or may not need a terminator. This depends on whether the device supplies termination power. If you use a terminator, be sure you place it at the very end of the SCSI chain.

Termination is supplied by the internal hard drive
PowerBook computers depend on the internal hard drive to supply termination so that they are properly terminated when placed in SCSI disk mode. In SCSI disk mode the PowerBook is just another hard drive in the SCSI chain because all other subsystems have been shut down. Therefore, when a PowerBook is in SCSI disk mode, it should be the last device in the SCSI chain.

Only one PowerBook can be in SCSI disk mode on a SCSI bus
If you have two PowerBook computers and other devices on the chain, one PowerBook must be the very last device in the SCSI chain (in SCSI disk mode) and the second PowerBook must be at the beginning of the chain. In this situation, one PowerBook is the CPU and the other is in SCSI disk mode.

PowerBook SCSI cables are different
Note the difference between the disk adapter cable (used only for SCSI disk mode) and the system cable (used to connect external devices to the PowerBook). The only true difference between these two cables is an extra pin in the adapter cable, which triggers SCSI disk mode in the machine.

Not all PowerBook computers support SCSI disk mode
Consult your owners manual to determine if yours does. As of this writing, all PowerBook computers except the 140, 145, 145B, 150, and 170 support SCSI Disk Mode.

Apple Cable Part Numbers

- SCSI System Cable, M0206
- HDI-30 SCSI System Cable, M2538LL/A
- HDI-30 SCSI Disk Adaptor Cable, M2539LL/A
- SCSI Peripheral Interface Cable, M0207
- SCSI Cable Extender, M0208LL/B
- SCSI Cable Terminator, M3503LL/A
- SCSI Cable Terminator II (black), M5871G/A

iTunes Store receipt displays incorrectly in some email programs

- **Last Modified:** July 02, 2004
- **Article:** TA27745

- **Old Article:** 93873

If your iTunes Store receipt doesn't display correctly in your email application, you can view your purchase history in iTunes.

Products Affected

iTunes Store, iTunes

For example, the itemized list section of iTunes Store receipt emails can look like this when viewed in Eudora:

If this is the case, try another email application or go to the iTunes Store to check your purchase history.

BMW iPod Adapter FAQ

- **Last Modified:** June 01, 2007
- **Article:** TA27749

- **Old Article:** 93879

Thinking about getting the iPod adapter for your BMW? Find out the answers to some frequently asked questions.

Products Affected

iPod

Questions answered in this document

Availability and description

1. When is the BMW iPod Adapter available?
2. Where can I purchase the BMW iPod Adapter and how much does it cost?
3. Does the BMW iPod Adapter include an iPod or iPod mini?
4. What is the BMW iPod Adapter?
5. How does the BMW iPod Adapter work?
6. Which vehicles support the BMW iPod Adapter?
7. Which iPod models are compatible?
8. What are the available functions?

Using the BMW iPod Adapter

9. Can I leave my iPod or iPod mini in the car at all times?
10. How will the adapter show up on the BMW's radio?
11. What are the advantages of using the BMW iPod Adapter over other types of adapters?
12. What will the BMW's audio system display when playing a song?
13. Can I browse iPod or iPod mini by artists, song title, album, or genre using the radio controls?
14. How do I make a BMW playlist in iTunes?
15. What happens if I don't have a BMW playlist for one of the numbered presets on my BMW audio system?
16. What if there are no songs in one of the BMW playlists?
17. Does the BMW iPod Adapter recognize iPod's "On-The-Go" playlist?
18. How do I connect the iPod or iPod mini to the BMW iPod Adapter?
19. How do I know if the iPod and the BMW are communicating?
20. Can I play iPod immediately after connecting to the BMW iPod Adapter?
21. What does it mean if my BMW audio system's interface is displaying "CD 9-99"?
22. How do I play one of the BMW Playlist on the iPod or iPod mini?
23. How do I play all the audio tracks on iPod or iPod mini?
24. Where can I get more information on the BMW iPod Adapter?

Availability and description

1. **Question**: When is the BMW iPod Adapter available?
   Answer: The BMW iPod Adapter will be available on July 12, 2004.

2. **Question**: Where can I purchase the BMW iPod Adapter and how much does it cost?
   Answer: You should contact your BMW dealership for information regarding cost of the BMW iPod Adapter and installation cost.

3. **Question**: Does the BMW iPod Adapter include an iPod or iPod mini?
   Answer: No. It must be purchased separately.

4. **Question**: What is the BMW iPod Adapter?
   Answer: It's an adapter, neatly concealed behind the radio with the cable in the glovebox, that connects an iPod or iPod mini to the BMW audio system

and allows you to select your music using the vehicle's radio and steering wheel controls.

5. **Question**: How does the BMW iPod Adapter work?
   Answer: The iPod adapter translates commands between the BMW audio system and the iPod. The adapter allows your iPod or iPod mini to take the place of a BMW CD Changer, although there will be differences in operation that are noted in BMW's iPod Adapter Owner's Manual.

6. **Question**: Which vehicles support the BMW iPod Adapter?
   Answer: For information on which vehicles support the BMW iPod Adapter, go to the website iPodyourBMW or check with your BMW dealership.

7. **Question**: Which iPod models are compatible?
   Answer: Any iPod model with a dock connector is compatible, running iPod mini version 1.1 or greater, or iPod Software version 2.2 or greater software.

8. **Question**: What are the available functions?
   Answer: Supported functions include:
   - Playback up to 5 unique BMW playlists, which you have created in iTunes.
   - Playback of all the music content on iPod or iPod mini.
   - Scan each track in a playlist or all tracks in iPod or iPod mini for 10 seconds each.
   - Repeat the current track being played (not available on Z4 or Z3).
   - Shuffle for the current selected BMW playlist or the entire iPod or iPod mini music contents.
   - Next and Previous Track.
   - Fast Forward, and Fast Backward to skip through a track at a high speed.

Using the BMW iPod Adapter

9. **Question**: Can I leave my iPod or iPod mini in the car at all times?
   Answer: The interior of your car can reach extreme temperatures that could damage your iPod or iPod mini. Do not operate your iPod or iPod mini in temperatures below 32° F (0° C) or above 95° F (35° C) or store it where temperatures could drop below -4° F (-20° C) or exceed 113° F (45° C).

10. **Question**: How will the adapter show up on the BMW's radio?
    Answer: The BMW radio will display "CD" when using the BMW iPod Adapter

11. **Question**: What are the advantages of using the BMW iPod Adapter over other types of adapters?
    Answer: The iPod adapter offers the following benefits:
    - Charging of the internal battery for iPod and iPod mini.
    - Controlling iPod or iPod mini via vehicle radio and steering wheel controls.
    - Direct audio interface with the BMW vehicle audio system for optimal audio playback from the iPod or iPod mini.

12. **Question**: What will the BMW's audio system display when playing a song?
    Answer: Just like a CD Changer, the BMW audio system's interface will display the track number. It will not display the name of the artist, song title, or album title of the song that is currently playing.

13. **Question**: Can I browse iPod or iPod mini by artists, song title, album, or genre using the radio controls?
    Answer: No, when connected through the adapter, you cannot browse iPod or iPod mini songs by artist, song title, album or genre.

14. **Question**: How do I make a BMW playlist in iTunes?
    Answer:
    Here's some examples of acceptable names for a BMW playlist:

    - BMW1 - Rock
    - BMW3_Jims Mix
    - BMW2 highway mix

    To create a BMW playlist:

    1. Open iTunes.
    2. From the **File** menu, choose **New Playlist**.
    3. As in the examples above, name the playlist "BMW#XXX", where # is a number (1 to 5) and "XXX" is anything you want to follow. "BMW" must be in capital letters, and there can be no spaces between "BMW" and the number. Incorrect examples:
       - Bmw1
       - BMW_1
       - BMW 1
       - BMW6 (acceptable format, but can only use presets 1-5)
    4. Add songs from the iTunes library to the playlist.
    5. Synchronize the playlist to iPod or iPod mini.

    When your iPod or iPod mini is connected to your BMW vehicle, the iPod adapter scans all available BMW playlists. Playlists are allocated to preset buttons on the BMW's audio system in the following manner:
    Preset 1: "BMW1..."

Preset 2: "BMW2..."
Preset 3: "BMW3..."
Preset 4: "BMW4..."
Preset 5: "BMW5..."

Example Playlist in iTunes:

15. **Question**: What happens if I don't have a BMW playlist for one of the numbered presets on my BMW audio system?
Answer: You simply won't have a playlist available for the corresponding button. Example: Without a playlist named "BMW5...", preset button 5 selects nothing.

16. **Question**: What if there are no songs in one of the BMW playlists?
Answer: If there are no audio tracks in a playlist, the BMW audio system won't recognize the playlist.

17. **Question**: Does the BMW iPod Adapter recognize iPod's "On-The-Go" playlist?
Answer: No.

18. **Question**: How do I connect the iPod or iPod mini to the BMW iPod Adapter?
Answer: It's important to follow the directions in the BMW iPod Adapter's Owner's Manual. Turn your BMW radio ON before connecting your iPod or iPod mini. Turn your BMW radio OFF before disconnecting.

19. **Question**: How do I know if the iPod and the BMW are communicating?
Answer: A few moments after connecting iPod or iPod mini to the BMW iPod Adapter, the iPod's display should read "BMW OK to disconnect."

20. **Question**: Can I play iPod immediately after connecting to the BMW iPod Adapter?
Answer: After the "BMW OK to disconnect" message appears on the iPod, press the MODE button on the BMW audio system until "CD" appears in the display. After successful connection and synchronization, the radio will display one of the following "CD -" or "CD 0-." Synchronization timing may vary according to the number of playlists on your iPod or iPod mini. Please wait until the radio display indicates that the iPod or iPod mini is successfully connected to your iPod adapter before starting playback.

21. **Question**: What does it mean if my BMW audio system is displaying "CD 9-99"?
Answer: It may mean the iPod or iPod mini was disconnected from the BMW iPod Adapter during playback. This remains for about 10 seconds, then the radio will automatically change to AM/FM mode. You may also see this message if you try to select iPod mode too soon after connecting the iPod (see previous question). After a few moments the display will transition to "CD-" or "CD 0-."

22. **Question**: How do I play a BMW Playlist on the iPod or iPod mini?
Answer: To play a BMW Playlist on the iPod or iPod mini, select one of the BMW audio system's first five preset buttons. After a few seconds the playlist will begin playing, and the playlist number and track number will appear in the audio system's display.

23. **Question**: How do I play all the audio tracks on iPod or iPod mini?
Answer: Select the number six preset button on the BMW's audio system. When playing all the audio tracks on the iPod or iPod mini the BMW's audio system will display the playlist as number zero or blank.

24. **Question**: Where can I get more information on the BMW iPod Adapter?
Answer: By visiting your local BMW dealership or the website iPodyourBMW.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

TA27749_BMW_iPod_Adapter_FAQ.pdf

Archived - Xserve G5: Xserve Remote Diagnostics appears to stop functioning with Apple Fibre Channel PCI card installed

When using Xserve Remote Diagnostics to diagnose an Xserve G5 that has an Apple Fibre Channel PCI card installed, the application may appear to stop functioning while obtaining information about the hardware installed in the Xserve G5.

Products Affected

Xserve

This article has been archived and is no longer updated by Apple.

Symptom

On the admin computer, you will see the message "Probing the hardware...", and nothing else will appear. The CPU indicator lights on the Xserve G5 will stop flashing in the normal pattern used by Xserve Remote Diagnostics.

If there is a display attached to the Xserve G5 when Xserve Remote Diagnostics appears to stop functioning, you may see alert information on the display such as "Write to location ZERO detected, location ZERO was originally 0", followed by some program trace information.

Products affected

- Xserve G5 with Apple Fibre Channel PCI card

Solution

This issue is caused by incorrect reporting in the Xserve Remote Diagnostics software and does not indicate an issue that would require hardware replacement.

There are two easy ways to work around this:

- Disconnect the Fibre Channel cables from the Apple Fibre Channel PCI card, or
- Power on the Xserve RAID that is connected to the Apple Fibre Channel PCI card.

Tip: If Xserve Remote Diagnostics has stopped functioning, you should quit Xserve Remote Diagnostics by typing Control-C or Command-period, and you should power off the Xserve G5 currently being diagnosed, before correcting the problem.

Final Cut Pro HD: Keyframes are not pasted when you choose Paste Attributes

- **Last Modified:** May 24, 2006
- **Article:** TA27752

- **Old Article:** 93882

Products Affected

Final Cut Pro 5.X, Final Cut Studio, Final Cut Pro

When you paste the attributes of one clip onto another, keyframes are not pasted, even though you selected the checkbox for Filters.

Normally, the Paste Attributes command is valuable for selectively copying attributes from one clip to another without having to open clips in the Viewer, eliminating the need to repeat steps when applying identical effects to multiple clips.

If you select the Filters checkbox, the filters for the copied clip are pasted as specified, but any keyframes added to the clip are not pasted.

One workaround is to drag the filter from a clip in the Effects tab of the Viewer onto the clip where you want the keyframes, as pictured here:

In this example, the filter and its keyframes are copied from Clip001 to Clip002. One drawback to this workaround is that the timing of the keyframes is not scaled, so this may only be practical for clips that have identical durations.

This behavior was improved in Final Cut Pro versions after Final Cut Pro HD (4.5).

In Final Cut Pro 5.0 and 5.1, keyframes from the Motion tab are pasted if selected, and the timing of the keyframes is scaled for parameters in the Motion tab, if Scale Attribute Times is selected. Filter keyframes are also pasted, but their timing will not be scaled. The Scale Attribute Times setting does not apply to the timing in Filters.

Ejecting iPod during sync may cause iTunes for Windows to "freeze"

- **Last Modified:** July 20, 2004
- **Article:** TA27756

- **Old Article:** 93886

Trying to eject your iPod while it is syncing may cause iTunes to stop responding, and your PC may not eject your iPod.

Products Affected

iPod

This can happen in iTunes 4.6 on Windows XP or Windows 2000 with an iPod (with Dock Connector) or iPod (Click Wheel) when connected using USB 2.0.

To prevent this from happening, cancel the sync before trying to eject iPod or wait until the sync is complete.

If this has already happened and iTunes has stopped responding, follow these steps:

1. Open Windows Task Manager by pressing the Control-Alt-Del keys.
2. Click the Applications tab.
3. Select iTunes in the list of tasks.
4. Click the End Task button at the bottom of the Task Manager window.
5. Open iTunes.
6. Click the "Safely Remove Hardware" button in the system tray to eject iPod.

What is iPod Software 3.0?

- **Last Modified:** October 12, 2004
- **Article:** TA27757

- **Old Article:** 93887

The Read Me for iPod Updater 2004-07-15 mentions iPod Software 3.0.

Products Affected

iPod

The iPod Software in this case is the software that runs on the iPod, not the iPod Updater. iPod Software 3.0 is installed by "iPod Updater 2004-07-15" and is only for iPod (Click Wheel). iPod Updater 2004-07-15 also includes software for all other iPods.

Starting with iPod Updater 2004-04-28 and later, you can see which versions of iPod software gets installed for each respective iPod. To do this, open iPod Updater.

On a Mac:

- From the **File** menu, choose **About iPod Updater**.

In Microsoft Windows:

- Right-click on the iPod Updater window's title bar.

You can always find the latest version of the iPod Updater at the iPod download page.

Use only DVD-R discs with iDVD 4

- **Last Modified:** July 19, 2004
- **Article:** TA27759

- **Old Article:** 93890

iDVD 4 requires DVD-R discs for burning.

Products Affected

iDVD

A number of different recordable DVD media types are available. When you use iDVD 4, only use DVD-R type discs. DVD+R, DVD+RW, DVD-RW, and DVD-RAM discs are not supported with iDVD 4 or with previous versions of iDVD.

iPod (Click Wheel) USB cable is incorrectly labeled "PC Only"

- **Last Modified:** July 21, 2004
- **Article:** TA27760

- **Old Article:** 93891

The USB cable included with your iPod (Click Wheel) may be incorrectly labeled as "USB 2.0 PC only".

Products Affected

iPod

The label should just say "USB 2.0".

The cable works equally well with Macs that have Mac OS X 10.3.4 or later.

For more information, see Should I use FireWire or USB to connect iPod with my Mac?

Saving your On-The-Go playlists

- **Last Modified:** July 27, 2004
- **Article:** TA27763

- **Old Article:** 93908

Want to make a playlist away from your Mac or PC? Queue up as many songs as you like on iPod or iPod mini. When you create a list of songs on your iPod, the songs appear in an On-The-Go playlist. iTunes saves playlists to your computer next time you autosync.

Products Affected

iPod

Make sure to save the playlist after you create it on your iPod. While there is a Save Playlist command, you need to play a song--any song--for iPod to save the list to its hard disk. If you don't save the playlist by playing a song, it could be lost if you don't use iPod for more than 36 hours.

The On-The-Go playlist is a feature that can be used with any iPod that includes a Dock Connector. This includes iPod (with Dock Connector), iPod mini, and iPod (Click Wheel). The Save Playlist feature is available only on iPod (Click Wheel).

iPod Software 3.0: Reset All Settings does not reset audiobook playback speed

- **Last Modified:** January 08, 2007
- **Article:** TA27769

- **Old Article:** 93918

iPod Software 3.0 has a feature that allows you to adjust the playback speed of an audiobook to faster or slower than normal.

Products Affected

iPod

The Reset All Settings option on the iPod resets all the different settings on iPod back to their default settings. However, the Reset All Settings does not reset the audiobook playback speed.

The default setting for this is Normal. To change this setting back to the default: On the iPod choose Settings > Audiobooks > Normal.

iPod (Click Wheel): Windows CD Installer says "iPod Needs To Be Reformatted"

- **Last Modified:** August 10, 2004
- **Article:** TA27770

- **Old Article:** 93919

If you're installing the Windows software that came with your iPod (Click Wheel), you might one or both of these messages at the end of the installation: "iPod Not Readable" or "iPod Needs To Be Reformatted".

Products Affected

iPod

If you already clicked Configure at the beginning of the installation, this step is not required. You can simply click Finish to restart your computer.

Don't worry if you already clicked Update instead of Finish. It does the same thing as Configure at the beginning of the installation.

Motion: Color value change of LiveFont in Canvas results in inaccurate values

- **Last Modified:** August 10, 2004
- **Article:** TA27771

- **Old Article:** 93920

Learn about an issue that can occur when making color changes to a LiveFont object in Motion.

Products Affected

Motion

Symptom
When you change the color of a LiveFont object, the color well in the Dashboard or the Style pane of the Inspector updates correctly. However, the LiveFont object in the Canvas does not accurately reflect the color change.

Products affected

- Motion

Solution
If you have Final Cut Pro 4 or Final Cut Pro HD (4.5) or later, use LiveType to create the same LiveFont text with color changes.

This document will be updated when additional information is available.

iPod (Click Wheel) pauses when headphone connector is unplugged

- **Last Modified:** July 29, 2004
- **Article:** TA27772

- **Old Article:** 93921

Getting a surprise pause when you unplug something?

Products Affected

iPod

iPod (Click Wheel) pauses playback when anything connected to the headphone jack (such as headphones or the remote) is removed. Pressing the Play button will resume playback.

Archived - iTunes for Windows: Installers may offer Repair or Remove options

Some iTunes for Windows installers may offer to repair or remove iTunes. This includes some on CDs bundled with products such as iPod or AirPort Express.

Products Affected

AirPort, iPod, iTunes

This article has been archived and is no longer updated by Apple.
This is normal behavior and happens when the version you are installing matches the version you already have installed.

Because the installer may install some extra software for the product you purchased, simply click Repair to be sure you have everything you need to get started.

Which Belkin card readers work with my iPod?

- **Last Modified:** August 03, 2004
- **Article:** TA27780

- **Old Article:** 93935

So you want a Belkin card reader to use with your iPod? Find out which readers from the Apple Store are compatible with your iPod.

Products Affected

iPod

The Photo Import option is available on iPod software 2.1 and later, which includes iPod (Dock Connector) and iPod (Click Wheel) models. It does not include iPod mini.

iPod (Dock Connector) can use:

- Digital Camera Link for iPod
- iPod Media Reader

iPod (Click Wheel) can use:

- iPod Media Reader

If you're not sure which iPod you have, click here. Check with Belkin for the latest information on product compatibility.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

How iTunes remembers audio CDs

- **Last Modified:** May 08, 2007
- **Article:** TA27785

- **Old Article:** 93952

Ever wonder how iTunes knows the name of the audio CD you just put in? Or why it may not remember the name of some burned CDs? If so, then read on.

Products Affected

iTunes, Windows Vista, Windows XP, Windows OS

Remembering purchased audio CDs
When you insert a store-bought audio CD into your computer, iTunes goes online to the CDDB and finds the CD and track names based on the lengths of each track and the overall length of the CD. iTunes then saves this information for the CD into the "CD Info.cidb" file. It's saved here:

Mac OS X: /Users/username/Library/Preferences
Windows Vista: /Users/username/AppData/Roaming/Apple Computer/iTunes Windows XP and 2000: \\Documents and Settings\\username\\Application Data\\Apple Computer\\iTunes

Each time you reinsert that CD into the same computer while logged in as the same user, iTunes will "remember" the information without having to look it up on the Internet again.

Remembering audio CDs you burn
iTunes also adds an entry to the "CD Info.cidb" file every time you burn an audio CD. This is how iTunes "remembers" the CD and track names for every mix CD you burn. The CD and track names are not burned anywhere onto the CD itself. If you insert the burned audio CD into another computer, the CD will appear as "Audio CD" with generic track names. The one exception to this rule is if you burn the tracks from a particular audio CD exactly as they are on a store-bought audio CD. Since the track length and the overall CD length is the same as the store-bought album, iTunes finds the information for the store-bought album when it looks the CD up online.

Remembering CD information you enter manually
If you enter a CD's track names manually, iTunes also saves this information in the "CD Info.cidb" file.

Windows PC does not start up when iPod is connected

- **Last Modified:** July 06, 2006
- **Article:** TA27786

- **Old Article:** 93953

Products Affected

iPod photo, iPod nano, iPod shuffle, iPod mini, iPod, iPod, iPod (5th generation)

If your Windows-compatible PC won't start up until you disconnect your iPod, the computer's BIOS[1] may be configured to start from a FireWire or USB drive.

If this is the case, you will see a black screen with a flashing white cursor at the top of the screen. Once you disconnect iPod, the computer starts up normally.

This can happen if:

- Your Windows PC is capable of starting up from FireWire or USB drives.
  and
- The BIOS of your Windows PC has been configured to look for an external startup disk before looking for an internal startup disk.

The simplest solution is to disconnect the iPod from its cable or dock.

If you want to know more about why this occurs and another option to resolve it, keep reading.

Windows PCs have something called "boot order" that is configurable in the computer's BIOS ("boot" is an alternate name for a computer's startup process). The computer scans connected disks, in the specified boot order, for a compatible operating system to start up from.

A few examples of possible boot orders are:

- Floppy disk, CD-ROM, primary hard disk
- CD-ROM, primary hard disk, external hard disk
- Primary hard disk, floppy disk, CD-ROM, external hard disk

While iPod can be used as a hard disk in disk mode, it cannot be used as a startup disk.

What happens when a startup drive doesn't have an operating system?

What happens depends on the particular drive:

- When a PC checks a floppy disk and does not find a valid operating system, it typically prompts you to remove it before it can go to the

next device in the boot order.
- When a PC checks a CD-ROM and does not find a valid operating system, it typically skips over it to the next device in the boot order without an error.
- When a PC checks an external disk for a compatible operating system, however, it typically does not say when none is found, nor does the PC automatically skip to the next disk in the boot order.

How can I start up without disconnecting my iPod?

If you do not start up your computer from an external hard disk, one solution is to change your BIOS settings so that the internal hard disk is before any external hard disks in the boot order. Note that changing the BIOS may not help the issue and you may still need to disconnect the iPod at startup.

Another solution may be to disable your computer's ability to start up from FireWire and USB drives. Information on how to modify the BIOS settings of your specific PC should be available from your computer's manufacturer. If your PC is custom-built, you will need to consult the documentation that came with your logic board or look online at the logic board manufacturer's website.

Notes

1. BIOS is an acronym for basic input/output system and it lies in between the operating system and the computer's hardware and helps the hardware and software work together.

Where's the iPod About screen, and what's in it?

- **Last Modified:** January 08, 2007
- **Article:** TA27791

- **Old Article:** 93961

Products Affected

iPod photo, iPod nano, iPod mini, iPod, iPod, iPod (5th generation)

All iPods (except iPod shuffle) can display status information on the iPod "About" screen. To access this screen, choose **Settings > About** from the main menu.

The "About" screen displays the following information:

- **Name of iPod**
- **Songs:** The number of songs currently stored on iPod.
- **Videos:** The number of videos currently stored on iPod[1].
- **Photos:** The number of photos currently stored on iPod[2].
- **Capacity:** The size of the hard drive in bytes. Click here for more information on how the capacity is calculated.
- **Available:** How much space is available on iPod
- **Version:** The installed version of iPod Software
- **S/N:** The serial number of iPod.
- **Model:** The iPod model number
- **Format:** This option appears if iPod has been formatted for use with Windows-based computers.

Notes

1. This applies to iPod models that can display video.
2. This applies to iPod models with a color display.

What's New in DVD Studio Pro 3.0.2

- **Last Modified:** November 05, 2004
- **Article:** TA27792

- **Old Article:** 93962

Products Affected

DVD Studio Pro

The DVD Studio Pro 3.0.2 update includes the enhancements listed here.

Improved Double-Layer Compatibility
DVD Studio Pro 3.0.2, together with Mac OS X v10.3.6 or later, now support burning and reading from double-layer DVD recorders and media (DVD+R DL). DVD+R DL media makes it possible for you to store nearly twice as much data on a single-sided DVD (8.54 GB) compared to standard DVDs (4.7 GB).

DVD+R DL media makes it possible to burn a dual-layer project to a disc, with the project's dual-layer break point controlling when the double-layer drive switches from the first to the second layer.

To burn dual-layer projects to your double-layer drive, your system must have:

- DVD Studio Pro 3.0.2
- Mac OS X v10.3.6 or later
- The latest updates for your double-layer DVD recorder from your drive's manufacturer.

Enhanced Simulator
The Simulator is enhanced in the following ways:

- The Simulator toolbar button always launches the Simulator based on the first play setting. The Simulator is disabled if there is no first play item.
- Choosing File > Simulate or pressing Command-Option-O launches the Simulator based on the currently selected item in the Graphic or Outline tabs, or the currently active editor (Menu, Track, Slideshow, Story, or Script). If either the Graphic or Outline tab is currently active without any items selected, the Simulator launches based on the first play setting.
- You can now use the same background video on multiple menus with different loop points and AC-3 audio files.
- Enhancements to the Slideshow Editor.
- Improvements regarding importing Motion and LiveType projects.
- The menu backgrounds and overlays used when creating 16:9 menus are now scaled correctly in the Menu Editor and on burned discs.
- Improvements to the building and formatting processes.

Motion: Use field rendering when importing a project into DVD Studio Pro and Final Cut Pro

- **Last Modified:** February 16, 2011
- **Article:** TA27793

- **Old Article:** 93963

This article has been archived and is no longer updated by Apple.

To be sure fields are used from Motion projects, use field rendering. To do that: From the **View** pull-down menu of the Motion Canvas, choose **Field Rendering**. You may need to make another change to your Motion project and then save to have this change take effect.

Products Affected

Final Cut Pro, Motion, DVD Studio Pro

If you don't choose Field Rendering, Motion projects with fields set in the project properties will not pass those fields along when imported into DVD Studio Pro or Final Cut Pro. This will not be evident until the disc is burned or is output to a DV file. In these cases, the project either will not encode or will render with field interlacing.

Xserve G5: "Storage.Fixed.SMART Test Result Status" error appears in Xserve Remote Diagnostics 1.0

Learn what to do if you get a "Storage.Fixed.SMART Test Result Status" error when you run Xserve Remote Diagnostics.
This article has been archived and is no longer updated by Apple.
When you run Xserve Remote Diagnostics 1.0, you might see a message similar to this:

```
00:03:93:F5:19:F4 08/30/04 16:39:13 Testing [0000000A] Storage.Fixed.SMART Test Result Status
00:03:93:F5:19:F4 08/30/04 16:39:13 FAILED, result:6 "Error Writing to Device"
```

or

```
00:03:93:F5:19:F4 08/30/04 16:39:13 Testing [0000000A] Storage.Fixed.SMART Test Result Status
00:03:93:F5:19:F4 08/30/04 16:39:13 FAILED, result:14 "(null)"
```

This message may appear if the mass storage device being tested is the Xserve RAID. You can determine which mass storage device is being tested by matching the number shown in square brackets [0000000A] with the information shown in the DEVICE SUMMARY.

For example :

```
00:03:93:F5:19:F4 [0000000A] ? ? HDD 00:03:93:F5:19:F4 commodity-type : MASS 00:03:93:F5:19:F4 vendor : ?
00:03:93:F5:19:F4 model : ? 00:03:93:F5:19:F4 type : HDD 00:03:93:F5:19:F4 interface : SCSI 00:03:93:F5:19:F4
capacity : 555 00:03:93:F5:19:F4 location : SLOT-2, Channel: 2, ID: 0, LUN: 0 00:03:93:F5:19:F4 version : 1.16
00:03:93:F5:19:F4 bsd-name : ? 00:03:93:F5:19:F4 is-boot-drive : FALSE
```

The above example indicates a Xserve RAID device (shown as a SCSI device, even though the individual hard drives are connected using an ATA or SATA interface).

This does not indicate an issue with your Xserve G5 or Xserve RAID. This alert is caused by a reporting issue in the software.
You can either ignore the "failure" or turn off the "Storage.Fixed.SMART Test Result Status" test by following these steps:

1. Optionally, start by making a backup copy of the test definition file that you will be modifying. Two files have the same test - quick.tdf and extended.tdf. Copies of these files are found in ~/Library/Application Support/xrdiags/.
2. Using a text editor such as TextEdit, open either or both of the test definition files mentioned in step 1 (quick.tdf and extended.tdf).
3. Navigate to the line of the file that looks like the following: In quick.tdf:

   ```
   TEST 1 FALSE "Storage.Fixed" QUICK OF SA 19 [commodity-type='MASS',type="HDD"] "SMART Test Result Status"
   "SMART Threshold Exceeded Limits Results" "" "" ""
   ```

   In extended.tdf:

   ```
   TEST 1 FALSE "Storage.Fixed" EXTENDED OF SA 19 [commodity-type='MASS',type="HDD"] "SMART Test Result
   Status" "SMART Threshold Exceeded Limits Results" "" "" ""
   ```

4. Either delete the line in its entirety, or simply add a hash mark (#) to the beginning of the line, to comment the line out. For example:

   ```
   #TEST 1 FALSE "Storage.Fixed" QUICK OF SA 19 [commodity-type='MASS',type="HDD"] "SMART Test Result
   Status" "SMART Threshold Exceeded Limits Results" "" "" ""
   ```

5. Alternatively, you may correct the test definition so that the test is only run on devices connected with an ATA or SATA interface. Do this by duplicating the test definition line, and adding the additional `,interface="ATA"` or `,interface="SATA"` parameter inside the square brackets, as shown below. Please note, there should be no white space between the parameters. For example :

   ```
   TEST 1 FALSE "Storage.Fixed" QUICK OF SA 19 [commodity-type='MASS',type="HDD",interface="ATA"] "SMART
   Test Result Status" "SMART Threshold Exceeded Limits Results" "" "" "" TEST 1 FALSE "Storage.Fixed" QUICK
   OF SA 19 [commodity-type='MASS',type="HDD",interface="SATA"] "SMART Test Result Status" "SMART Threshold
   Exceeded Limits Results" "" "" ""
   ```

6. Save changes and close the document. The incorrect tests will no longer be included the next time Xserve Remote Diagnostics are run.

This document will be updated when more information becomes available.

Last Modified: Feb 19, 2012

Additional Product Support Information

About Xserve G5 Firmware Update Version 5.1.7f1

- **Last Modified:** September 11, 2004
- **Article:** TA27804

- **Old Article:** 93980

The update includes changes for initializing and running your Xserve G5. It provides enhanced reliability during reboot sequences as well as support for the Xserve G5 PCI Hardware RAID Card. This firmware update is required for Xserve G5 customers who wish to install the Xserve G5 PCI Hardware RAID Card kit and is strongly recommended for all Xserve G5 systems with earlier firmware versions.

Products Affected

Xserve

The Xserve G5 Firmware Update 5.1.7f1 will run only on Xserve G5 systems. This updater can be run remotely (using SSH) as the root user or locally from the Finder if your system has a video card and you have a keyboard and monitor connected to the system. In either case, you must have physical access to the server at the time of the update. The system must be unlocked and an Open Firmware password must not be active at the time of the update.

To upgrade the firmware on your Xserve G5, follow the steps below. You can print these instructions so they are available while you upgrade your firmware. (The first set of instructions covers updating the firmware using a remote computer. The second set covers updating locally.)

Updating the Xserve G5 firmware using a remote computer

1. If you downloaded the update using the Software Update Preference Pane or softwareupdate command line tool, the Xserve G5 Firmware Update application is located in /Applications/Utilities. If you downloaded the update from Apple's web site, copy the Xserve G5 Firmware Update from the disk image you downloaded to the /Applications/Utilities folder on the startup disk of the Xserve G5 system to be updated.

   Type the command below to copy the update file:

   ```
   % sudo cp -R /Volumes/{Path to Updater}/Xserve\\ Firmware\\ Updater /Applications/Utilities/
   ```

2. Notify all users of the server that services will be interrupted briefly and the server will be restarted. (The system must be restarted to complete the firmware update and any users logged into the server will be disconnected.)

3. Stop all services that are running using the Server Admin application. (Do not restart the server.)

4. From a remote computer, use the Terminal application to log into the Xserve G5 system as root user using SSH. (See Mac Help if you need instructions.)

5. Run the updater by typing the following command:

   ```
   % /Applications/Utilities/Xserve\\ Firmware\\ Updater.app/Contents/MacOS/Xserve\\ Firmware\\ Updater -r
   ```

   If your system's firmware needs to be updated the Xserve G5 Firmware Updater will display instructions (in English, in the Terminal window) and shut down your system. If your firmware is up to date or if an error occurs, that information will be sent to the Terminal window.

6. Indicate your approval by typing "y" in the Terminal window to proceed with the update.

7. Once the Xserve G5 system has shut down, press and hold the power button until the blue system activity lights flash repeatedly; then release the power button.

   When you release the power button, the update starts automatically. Do not interrupt or power off the system while it is updating the firmware.

8. After the update is complete, your system shuts down but will restart automatically after a short pause.

Once the computer has restarted you can run the Xserve G5 Firmware Updater again to verify that the firmware was successfully updated; or check the firmware revision using Apple System Profiler (system_profiler command in Terminal). Your Xserve G5 should be at firmware revision 5.1.7f1. (If your Xserve G5 is still at firmware revision 5.1.6 or 5.1.7f0, repeat the firmware update procedure.)

Updating the Xserve G5 firmware locally, using a connected keyboard and monitor

1. If you downloaded the update using the Software Update Preference Pane or softwareupdate command line tool, the Xserve G5 Firmware Update application is located in /Applications/Utilities. If you downloaded the update from Apple's web site, copy the Xserve G5 Firmware Update from the disk image you downloaded to the /Applications/Utilities folder on the startup disk of the Xserve G5 system to be updated.

2. Notify all users of the server that services will be interrupted briefly and the server will be restarted. (The system must be restarted to complete the firmware update and any users logged into the server will be disconnected.)

3. Stop all services that are running using the Server Admin application. (Do not restart the server.)

4. Open the firmware updater.

5. Click Shut Down in the Firmware Update window to turn off your computer. Wait for your computer to shut down, saving changes if necessary.

6. Once the Xserve G5 system has shut down, press and hold the power button until the blue system activity lights flash repeatedly; then release the power button.

   When you release the power button, the update starts automatically. Do not interrupt or power off the system while it is updating the firmware. A status bar shows the progress of the update.

7. After the update is complete, your system shuts down but will restart automatically after a short pause. A message reports that your computer's firmware has been successfully updated to version 5.1.7f1. If you do not see this message or the update version is not 5.1.7f1, repeat the update procedure.

For more information, go to www.apple.com/support and search for Xserve.

iMovie 4: How to Export as DV-PAL

- **Last Modified:** March 14, 2005
- **Article:** TA27805

- **Old Article:** 93981

To export as DV-PAL, see Exporting your movie for viewing in a PAL or NTSC format, and choose DV-PAL in step 6.

Products Affected

iMovie

What not to do
This sequence of events may be confused with the correct action and thus is notable for the undesired result: Starting with a PAL imported video in iMovie 4, choose **Share** from the **File** menu, then choose the **Full Quality DV** preset. When you do that, the export is exported to PAL-DVCPRO.

Making a numbered list that spans multiple slides in Keynote

Do you have a numbered bullet list that's too long to fit one slide? No problem--use this trick to continue the list on the next slide.

Products Affected

Keynote

This article has been archived and is no longer updated by Apple.
Let's say your last list item in slide one is number six, so you want to pick up with seven.

1. Bullet the rest of the list items in slide two.

2. Select all the bulleted items in slide two.
3. Open the Inspector, and select the Text pane.
4. From the pop-up menu below Bullets and Numbering, select Text Bullet.
5. Adjust the size to 100 percent.
6. Select the first item on slide two (the seventh item in your list).
7. Click on the Inspector.
8. Enter the number seven and a period (7.) in the Text field at the bottom of the Inspector.

9. Repeat steps seven and eight for all of the bulleted items on slide two.

Final Cut Pro HD won't open or unexpectedly quits after a Software Update

- **Last Modified:** February 16, 2011
- **Article:** TA27807
- **Old Article:** 93984

This article has been archived and is no longer updated by Apple.

If Final Cut Pro HD unexpectedly quits on you after using Software Update, a few short steps should fix it up.

Products Affected

Final Cut Pro

Warning: This document describes how to enter commands in the Terminal application. Users unfamiliar with Terminal and UNIX-style environments should proceed with caution. The entry of incorrect commands may result in data loss and/or unusable system software.

1. Save any files or work you may have open, because you'll need to restart the computer after these steps.
2. Open Terminal (found at /Applications/Utilities/).
3. Type

   ```
   sudo update_prebinding -root / -force
   ```

4. Press Return.
5. Enter your password when prompted.
6. The prebinding operation may take a few minutes. When it is complete, a new command-line prompt will appear. When this happens, please quit Terminal and restart your computer.

Final Cut Pro HD should now open normally.

This document will be updated when more information becomes available.

The clicker setting in the iPod (Click Wheel) and iPod mini resets to the default (playing through the iPod speaker) when the iPod goes into deep sleep after 36 hours of inactivity.

Products Affected

iPod mini, iPod, iPod

For more information about deep sleep click here.

To change the clicker setting back to your previous setting choose Settings > Clicker from the main menu and then select either Off, Headphones, or Both.

This article will be updated when new information becomes available.

Power Mac G5 sleeps randomly during use

- **Last Modified:** May 24, 2005
- **Article:** TA27810

- **Old Article:** 93988

Products Affected

Power Mac G5

Some Power Mac G5 computers may go to sleep unexpectedly while you're using them. The computer will operate normally for several minutes, and then go to sleep for no apparent reason. You may be able to wake the computer, but it may go to sleep unexpectedly again. You may also notice that the fans ramp up to a higher speed shortly before the computer sleeps.

If this occurs, update the computer to Mac OS X 10.3.8 or later. If the issue still persists after updating, contact Apple using the phone number listed in your inbox materials.

Power Mac G5 1.6 GHz: Kernel panic, USB, or other issues after installing firmware 5.1.5f1

Some 1.6 GHz Power Mac G5 computers don't work properly with Uniprocessor Firmware Update 5.1.5f1. However, Firmware Update 5.1.5f2 fixes these issues.

Products Affected

Power Mac G5

This article has been archived and is no longer updated by Apple.

Here are the issues you might see on a 1.6 GHz Power Mac G5:

- A kernel panic.
- A USB input device, such as a mouse or keyboard, becomes unresponsive.
- Bluetooth USB modules don't respond five minutes after starting up.
- Interruptions in iTunes audio playback.
- Disconnecting and reconnecting affected devices does not help.
- If you have any non-Apple memory (RAM), removing it usually stops the issue.

To resolve the issue, download and install the Power Mac G5 Uniprocessor Firmware Update (v5.1.5f2).

Important: Before updating, shut down the computer, then temporarily remove any non-Apple memory (RAM).

Once you have successfully applied the Firmware Update, you can reinstall any extra RAM.

Tip: To learn more about working with RAM, see the Power Mac G5 Do-It-Yourself Memory website.

If issues occur regardless of which RAM is installed (including just the Apple RAM that came with the computer), you can take your computer to an Apple Authorized Service Provider or Apple retail store for assistance.

Archived - Silentype: Pinouts (10/94)

This article documents the pinout configuration and signal name for the Apple SilenType printer.

This article has been archived and is no longer updated by Apple.
DB-9
Connector Signal Name
---
1 Shield Ground
2 +5 volts
3 Logic Ground
4 Serial Data
5 Machine Status
6 +12 volts
7 Power Ground
8 Store Clock
9 Shift Clock

The Silentype Printer needs its own specially designed interface card, or an Apple III with the built in Silentype port. It is not possible to connect it to any other type of interface card.

Macintosh Classic II: Math Co-Processor Card Availability

Can I put a math co-processor in a Macintosh Classic II?

This article has been archived and is no longer updated by Apple.
Though Apple has no plans to produce such a card such, the Macintosh Classic II has a processor-direct slot (PDS) for which third-parties could produce a math co-processor card.

Check periodically the Redgate library on AppleLink for a current product list of available cards.

Archived - Apple IIc: How to Determine If It Needs UniDisk ROM Upgrade

I have an Apple IIc, and I want to purchase a UniDisk 3.5 to use with it. My dealer said that some of the earlier Apple IIc computers need a ROM upgrade to support the UniDisk 3.5.

How can I determine if my Apple IIc needs the upgrade without bringing it to the dealer?
This article has been archived and is no longer updated by Apple.
Check your Apple IIc serial number. The Apple IIc systems that require the ROM upgrade for UniDisk 3.5 support are those with serial numbers lower than F6051GFA2S4000.

Another way to determine if your Apple IIc needs the ROM upgrade is to go into BASIC and type "PR#7" and press Return. If the Apple IIc responds with "AppleTalk Offline", you have the new ROM. If it tries to start up an external drive or returns "Check Disk Drive", you have the old ROM.

Your Apple service provider will perform the ROM upgrade free of charge.

System 7 Tune-Up 1.1.1: Availability, Installation

- **Last Modified:** April 29, 1999
- **Article:** TA27936

- **Old Article:** 10150

What version of System 7 Tune-Up should I use, and how should I install it?
What Version To Use

Use version 1.1.1 of System 7 Tune-Up. System 7 Tune-Up 1.1 was released and then recalled because it caused unpredictable system behavior in low-memory situations.

When To Install System 7 Tune-Up

If you use System 7.0 or System 7.0.1, Apple recommends installing System 7 Tune-Up 1.1.1. System 7.1 incorporates the functionality of System 7 Tune-Up 1.1.1, so there is no need to install it.

Availability

System 7 Tune-Up 1.1.1 is posted on AppleLink; follow this path:

Software Sampler
Apple SW Updates
Macintosh
System Software
System 7 Tune-Up 1.1.1

Installation Notes

Apple recommends installing System 7 Tune-Up 1.1.1 on all Macintosh systems running system software version 7.0 or 7.0.1. The components of System 7 Tune-Up 1.1.1 were rolled into system 7.1. Therefore, it isn't necessary to install the Tune-Up into any release of system software after that version.

If you upgrade a Macintosh with System 7 Tune-Up installed to System 7.1, the Installer will disable the Tune-Up software, but won't remove it. To save disk space, delete the Tune-Up file from your Extensions folder in the System Folder.

Before installing System 7 Tune-Up 1.1.1 on your Macintosh, read the entire Read Me file on the Tune-Up disk or the System 7 Tune-Up Version 1.1.1 Installation Instructions included in the Tune-Up 1.1.1 package.

To ensure proper software installation, Apple always recommends installing system, printer, or network software, including System 7 Tune-Up 1.1.1, via the Installer. There are only a few unusual circumstances when you wouldn't use the Installer.

Be sure to install the System 7 Tune-Up software last. System 7 Tune-Up was released AFTER AppleTalk Remote Access, and it contains newer System 7 resources (System 7 tuner, LaserWriter, StyleWriter 7.2.2, File Sharing Extension 7.2, Chooser 7.1, and various system software patches). If you don't install System 7 Tune-Up last, AppleTalk Remote Access will install older versions of some of these resources. Shared computers may not appear in the Chooser.

During System 7 Tune-Up installation, AppleTalk is set to "Inactive" in the Chooser. You need to set AppleTalk to "Active" in the Chooser, and restart your Macintosh. Then you'll be able to open the Network control panel, and avoid the message that "AppleTalk Remote Access has not been properly installed" when you try to use it.

The first time you start your computer with Extensions on WITH Tune Up 1.1.1 installed, the System 7 Tuner installs an INIT resource into the System file. You can only see this INIT resource with a tool like ResEdit. After that first install, you can boot with Extensions off and you are still protected from the disappearing folder problem. The INIT loads from the System file regardless of whether Extensions are on, BUT the System 7 Tuner MUST be in the Extensions folder. If you throw away your system and reinstall, you will be unprotected until you start up with Extensions on WITH Tune Up 1.1.1 installed.

System 7 Tune-Up 1.1.1 installs these files:

* System 7 Tuner 1.1 extension (new for version 1.1.1)
* LaserWriter 7.1.1 driver (new for version 1.1)
* StyleWriter 7.2.2 driver (no change)
* Chooser 7.1 (no change)

Archived - System 7.x.x: AppleTalk and ADSP Versions

What versions of AppleTalk and ADSP are included with System 7 and later versions of System software? Are there any newer versions available? If so, what benefits do they provide?
This article has been archived and is no longer updated by Apple.
AppleTalk version 56 (part of System 7), the ADSP stack is integrated with the rest of the AppleTalk stack.

The AppleTalk versions for System software 7.x.x are as follows:

* System 7 and System 7.0.1 come with AppleTalk v56. System 7 Tune-Up 1.1.1 does not change the version of AppleTalk installed.
* System 7.1 comes with AppleTalk v57.0.4.
* Both System 7 Pro and System 7.1.2 come with AppleTalk version 58.1.1.
* System 7.5 comes with AppleTalk version 58.1.3

The latest version of AppleTalk is v58.1.6 and is available on the PowerBook 190 and 5300 series computers. The latest Network Software Installer (NSI) is 1.5.1 which installs AppleTalk v58.1.5. AppleTalk v58.1.5 should be used except for the PowerBook 190 and 5300 series, or PCI-based Power Macintosh computers (7200, 7500, 8500, 9500) which requires Open Transport. (Search on Network Software Installer for specific content information.)

Below is a history of AppleTalk and ADSP version since System 7.0.

AppleTalk v57.0.1 and ADSP v57.0.1 changes
---
* Added support for multiple DDP addresses on a single computer.
* Some code was changed to be MC68040 friendly for the new Macintosh Quadra systems.
* Minor modifications to retry timer handling were made in both NBP and ATP. This should reduce traffic due to retransmissions on slower network links (2400 to 19.2KB serial lines).
* The Network Control Panel no longer allows you to select LocalTalk if the printer port is already open by another application.
* Reliability and performance of LocalTalk on Macintosh Plus systems has been improved.

AppleTalk v57.0.3 and ADSP v57.0.3 changes
---
* Improved support for MC68040-based computers.
* Support for the Macintosh PowerBook power-down modes.
* Smaller RAM footprint in the system heap.
* Performance improvements to the AppleTalk Transaction Protocol (ATP) to reduce network traffic when used with links such as AppleTalk Remote Access using 9600-bps modem.
* AppleTalk Data Stream Protocol (ADSP) and AppleTalk Session Protocol (ASP) now support AppleTalk Remote Access. Sessions with computers on the remote end of a phone connection will be torn down when the phone connection is broken.
* A bug was fixed in ATP which could cause an AppleShare client or file server to "hang" if any data wasn't received in the first attempt.

AppleTalk v57.0.4 and ADSP v57.0.4 changes
---
* A fix for a bug in ATP that could cause incoming GetRequest packets with a checksum to be dropped. This affects machines running fileshare if the client is sending packets with DDP checksums.
* A fix for ADSP so that an openRetries count of 255 actually means "infinite retries", as specified in the documentation, rather than 255.
* Improved performance under VM (virtual memory)
* Improved File share and AppleShare performance over LocalTalk.

AppleTalk v58 and ADSP v58 changes
---
* Adds support (instrumentation) for SNMP. Also includes continuing support for Apple's Router.

AppleTalk version 58.1.1 (NSI 1.4.1-no change to ADSP)
---
* A problem that existed with the LocalTalk SNMP byte counting code that would cause an occasional bus error was fixed. It was wrongly assumed that was ALWAYS a WDS pointer and that address was used to calculate the byte counts.
* Check for Slotless networking devices when coming out of sleep for the PowerBook Duos.
* Lap Manager only intercepts packets for SAP 0xAA or 0x00. An attempt will be made to deliver any packet for a destination SAP that is not 0xAA or 0x00 to the SAP listener. If no SAP listener is found, then the packet will be ignored. A check in LLCAttach was added for duplicate SAP or SNAP addresses. If so, then an error is returned.

AppleTalk version 58.1.4 changes
---

* The LAP Manager was fixed to avoid sending corrupted TEST and XID response packets in certain heavy traffic situations.

AppleTalk version 58.1.5 changes
---
* An address-mapping problem that could cause slowdowns in EtherTalk or TokenTalk networks was fixed.
* The LAP Manager was fixed to avoid sending corrupted TEST and XID response packets in certain heavy traffic situations.
* A bug that passed a corrupted length indication to multi-node clients was fixed.
* A VM problem that could cause hangs was fixed (this could also have occurred when Ram Doubler was active).
* A LocalTalk problem on Power Macintosh computers was fixed that prevented LaserWriter Bridge from working properly.
* An additional LocalTalk problem on Power Macintosh computers was fixed that caused slow performance when both LocalTalk and GeoPort were in use.

AppleTalk version 58.1.6 changes
---
* Included support for built-in infrared technology (IRTalk) found on the PowerBook 190 and 5300 series computers.

Macintosh: Mini DIN-8 to DB-9 Adapter Pinouts (10/94)

- **Last Modified:** October 12, 1994
- **Article:** TA27966

- **Old Article:** 1019

This article has been archived and is no longer updated by Apple.

This adapter cable is used to connect DB-9 cables to devices with Mini DIN-8 ports (such as on the Macintosh Plus or newer).

Circular 8 Signal DB-9
1 HSKo (+12V) 6
2 HSKi 7
3 TXD- 5
4 GND 3,1*
5 RXD- 9
6 TXD+ 4
7 No Wire
8 RXD+ 8

* Pins 1 and 3 on the DB-9 end are jumpered together.

The pins on the male end of the circular 8 connector are numbered as shown:

6 7 8
3 4 5
1 2

NOTE: The Macintosh Plus peripheral adapter cable is stamped with the number 590-0341; when reordering, however, be sure to use the cable's service part number, which is 699-0430 (older cables may be referred to as 699-0372).

Quadra 900, 950, AWS 95, WS 9150: Security Keyswitch

This article discusses the security keyswitch on the Quadra 900, 950, Workgroup Server 95, and Workgroup Server 9150.

This article has been archived and is no longer updated by Apple.
The Quadra 900, 950, Workgroup Server 95, and Workgroup Server 9150 come with a security keyswitch that allows owners to limit access to the computer.

The keyswitch has three positions: OFF, ON, and SECURE. The key can be removed while the switch is in any of the three positions. The operation of the keyswitch is designed to provide a first level of security for users who wish to use it, without being inconvenient for those who don't.

Keyswitch OFF Position

When the keyswitch is in the OFF position, the computer can't be turned on. Moving the keyswitch from either the ON or SECURE position to the OFF position turns the computer off.

Warning: Turning the keyswitch to OFF when the computer is running turns the power off immediately-- the system software doesn't have a chance to close files. If the computer is turned off by turning the keyswitch to OFF, data can be lost.

Keyswitch ON Position

When the keyswitch is in the ON position, the user controls the power the same way as on any other computer in the Macintosh II, Quadra, and Power Macintosh family. The computer can be turned on from the keyboard and turned off with the Shut Down menu item.

Keyswitch SECURE Position

When the keyswitch is in the SECURE position, the ADB devices and floppy disk drive are disabled. For example, the keyboard does not generate characters, or the mouse moves but no menus can be pulled down. Also, when power is applied to the computer while the keyswitch is in the SECURE position, the computer automatically starts up.

The SECURE position is intended for situations involving remote access, or in which the computer is a network server. In the SECURE position, the computer will automatically power on if power is disrupted (the power cable is removed, or power goes out).

Lost Keys

You should make several copies of the key immediately and place them in a secure location. Most key shops have blanks for the type of key used in the 900/950/AWS95/WS9150.

If the key is lost, you can take the computer to a locksmith shop and have them create a new key. If this option is not viable, an entire replacement lock assembly can be ordered from any Apple Authorized Service Provider. The part number is 705-0175.

Note: For security reasons Apple will not replace individual keys.

Apple III Port C: RS-232-C Pinouts & Configuration (10/94)

- **Last Modified:** October 12, 1994
- **Article:** TA27977

- **Old Article:** 1021

This article has been archived and is no longer updated by Apple.

The following table explains how use System Utilities to configure the driver for the RS-232 port (Serial Interface and Serial Card III). Remember to set the slot number on the Serial Card III driver.

Data Configuration Blocks:

Data Configuration
Block Address: $00
Baud rate:
110 $03
134.5 $04
300 $06
600 $07
1200 $08
1800 $09
2400 $0A
4800 $0C
9600 $0E

Data Configuration
Block Address: $00 $01
Data Format:
Bits Parity
8 none $00
7 odd $22
7 even $26
7 MARK $2A
7 SPACE $2E
6 odd $42
6 even $46
6 MARK $4A
6 SPACE $4E

Data Configuration * * *
Block Address: $00 $01 $02 $03 $04 $05 $06 $07 $08 $09 $0A $0B
Comm Protocol:

none $00
XON/XOFF $80 $13 $11 $DF $84 $00
ENQ/ACK $40 $05 $06 $50 $00
ETX/ACK $40 $03 $06 $50 $00
HW Handshake $00 $DF $84 $80

* $02 - Delay after CR
* $03 - Delay after LF
* $04 - Delay after FF

Delays (bytes $02, $03, and $04)

Using this driver to connect to a printer may require that you set delay times while the printer advances to a new line or the top of a new page. These delays are given in the range $00...$FF characters. The RS-232 driver will wait for the time taken to transmit the amount of character specified before it sends the following character.

Pinouts:

DB-25
Connector Signal Name
1 ..... Shield Ground
2 ..... Transmit Data (Tx)
3 ..... Receive Data (Rx)
4 ..... Request to send (RTS)
5 ..... Clear To Send (CTS)
6 ..... Data Set Ready (DSR)
7 ..... Signal Ground
8 ..... Data Carrier Detect (DCD)
20 ..... Data Terminal Ready (DTR)

Serial Card III has a modem eliminator button; when this button is "in", the above pinouts are correct. If the button is "out", this has the effect of a modem eliminator cable being installed. (For more information on modem eliminator cables, search this database for MODEM AND ELIMINATOR.)

Macintosh Quadra 950: SCSI Support

This article describes SCSI support in the Macintosh Quadra 950.
This article has been archived and is no longer updated by Apple.
As in the Macintosh Quadra 900, the SCSI bus in the Macintosh Quadra 950 is divided into internal and external buses, each controlled by its own identical IC -- an NCR 53C96 device. Therefore, the internal and external SCSI buses are logically connected through software, but are electrically separate. The goal of this design was to develop a combination of controller, cabling, and termination for the internal SCSI devices which permits data transfer rates approaching the NCR 53C96 controller limit of 6 MB/s. The cabling and termination of the internal SCSI bus are optimized so that the 53C96 that controls the internal bus can support data transfers at a faster rate: up to 5 MB/s with existing faster third-party hard drives. The improved SCSI performance will result in increased system responsiveness when accessing large amounts of data on a fast hard drive.

The internal SCSI channel also supports an active termination which improves SCSI bus signal quality and reliability through improved transmission line and terminator design. This means that only one terminator is needed at the end of the external SCSI chain. The external channel's termination also offers a more uniform impedance and cleaner termination scheme. However, because external cabling and termination are less predictable, performance on the external bus could be lower than the internal. Electrically isolating the two channels ensures that changes in external cabling and termination don't impact the performance of the internal devices.

Even though the internal and external SCSI chains are physically different, they are still logically the same, and can therefore, like all Macintosh systems, accommodate up to seven SCSI devices. You must make sure that every device has a different SCSI ID number, regardless of which SCSI chain the device is connected to. You cannot use SCSI ID 7, and SCSI ID 0 is usually reserved for the internal hard disk. The added value of the Macintosh Quadra 950 dual-controller design is that the internal hard drive(s) performance won't be affected by problematic devices (like a scanner) attached to the external SCSI connector. Improvements in signal quality on the SCSI bus results in higher SCSI reliability.

Additional Product Support Information

Macintosh Quadra 950: Integrated Circuits

The circuitry of the Macintosh Quadra 950 computer has many new features along with older features it shares with the Macintosh IIci and IIfx computers. Certain components appeared for the first time in the Macintosh Quadra 900, and are therefore present in the Quadra 950 as well:

- The MC68040 microprocessor
- Several new custom ICs
- The built-in video hardware
- The 68040 PDS slot.

This section describes the circuit design of the Macintosh Quadra 950.
This article has been archived and is no longer updated by Apple.
There are three buses in the Quadra 950 computer:

- System bus

- I/O bus

- NuBus

The system bus connects directly to the pins of the MC68040 microprocessor and runs at the processor's clock rate of 33 MHz. The system bus is a high performance bus, with the capability to read burst-read and burst-write. Five controller ICs are connected to the system bus:

- Orwell, the custom memory controller

- YANCC, the NuBus controller

- DAFB, the frame-buffer controller

- The two 53C94 SCSI controllers

The I/O bus in the Quadra 950 computer is similar to the I/O bus in the Macintosh IIfx computer. The I/O bus in the Quadra 950 computer runs at a clock rate of 25 MHz. The controller ICs that are connected to the I/O bus include new custom ICs along with ICs originally designed for the Macintosh IIfx, such as the IOPs.

The NuBus runs at a clock rate of 10 MHz and includes several features of NuBus '90, including a clock signal at 20 MHz between cards, which is twice the normal rate. This clock rate doesn't apply from card to CPU.

Integrated Circuits (ICs)

The Quadra 950 incorporates all of the same ICs that the Quadra 900 did, many Apple custom ICs, and some new ASICs.

The Apple custom ICs that the Quadra 950 computer shares with earlier Macintosh models include:

- AC/DC: a custom Color Look-Up Table and Digital-to-Analog Converter (CLUT/DAC) IC developed by Apple and used in the Macintosh Display Cards 4*8, 8*24, and 8*24 GC, but improved in the Quadra 950.

- DFAC (Digitally Filtered Audio Chip): the sound input and filter IC first used in the Macintosh LC

- IOP: the I/O processors first used in the Macintosh IIfx

- SWIM: the IC that supports the SuperDrive disk drive

The Apple custom ICs that are newly designed for the Quadra 950 computer are:

- BATMAN: a custom IC (replaces the Apple Sound Chip) that acts as a sound amplifier

- SPORTY: a custom IC that provides sound output functions

- CABOOSE: a custom processor that manages system power, the real-time clock, and parameter RAM

- DAFB (Direct Attach Frame Buffer): an IC that connects directly to the system bus and controls the video RAM or frame buffer

- ORWELL: a custom IC that connects to the system bus and controls burst-mode data transfers to the main RAM

- JDB (Junction Data Bus): one of two ICs making up the I/O Adapter, connecting the data signals from the system bus and the I/O bus

- RELAYER: one of two ICs making up the I/O Adapter, controlling the bus buffers and proving bus arbitration logic

- YANCC (Yet Another NuBus Controller Chip): a custom IC that controls the NuBus interface

Third-party ICs include:

- SCSI interface ICs: two NCR 53C96

- Sonic: the DP83932 Ethernet controller IC made by National Semiconductor

- Two VIAs similar to those in earlier members of the Macintosh II family

I/O bus adapter ICs: JDB and Relayer

The I/O bus attaches local I/O devices to the system bus in a way that is flexible and highly compatible with previous Macintosh systems, and is fully buffered from the system bus to reduce capacitive loading. By putting Relayer and JDB between the system bus and I/O bus, none of the 040 signals go directly to the I/O chips, thus reducing the loading on the 040 bus signals, and increasing speed and reliability. The I/O bus hardware protocols are a subset of the 68030 bus protocols.

The two-chip set consisting of the Relayer and JDB provide a transparent connection between the system bus and the I/O bus. The I/O bus enables the Quadra 950 computer to use the same I/O device controllers used in the Macintosh IIfx. The I/O bus clock runs at 24.28 MHz and is completely asynchronous to the system bus clock.

This two-chip setup allows any system bus master such as the 040, a NuBus master card, or a master device on the PDS to request bus access and transfer data to slaves located on the I/O bus. It also allows I/O bus masters like SONIC to access main memory which is located on the system bus. This improves the overall speed of the system by isolating the faster bus (system bus) from the slower bus (I/O bus).

The I/O bus adapter is made up of two ICs: JDB and Relayer. Two ICs are used because of the high pin count required.

The functions of the Relayer IC include:

- Generating chip select and DSACK signals for devices on the I/O bus

- Converting timing signals between the system bus and the I/O bus

- Arbitrating between the system bus and the I/O bus

- Acting as watchdog for bus activity and time out

- Controlling the address-bus transceiver ICs

- Generating the clock signal for the VIA ICs

The functions of the JDB IC include:

- Controlling the data path (dynamic bus sizing and data byte lane routing)

- Synchronizing and distributing the reset signals

The ICs making up the I/O bus adapter contain no programmable registers and don't require support from the system software.

Memory Controller IC: Orwell

The Orwell IC connects to the system bus and provides control and timing signals for RAM and ROM. The Orwell IC supports all types of MC68040 memory access, including burst modes. Orwell allows all memory to be marked cache-able, which means cache-inhibit isn't asserted.

When the computer is reset, the Orwell IC maps ROM addresses into memory beginning at address $0000 0000 and disables the system RAM. As soon as the ROM code addresses the normal ROM space ($4000 0000), the Orwell IC automatically remaps the ROM to its normal addresses and restores RAM addressing starting at $0000 0000. The microprocessor always starts upon reset at address 0. At that time there is nothing in RAM (which resides at address 0 after reset). Therefore, ROM code needs to be accessed, and since its normal addressing starts at $4000 0000, it's remapped down so the processor has some code to fetch upon reset. This is the same process in every Macintosh II.

RAM Control

The Orwell IC controls four banks of dynamic RAM. Each bank accepts standard 80ns SIMMs containing 1MB, 4MB, and perhaps 16MB (256K and 2MB aren't supported), giving total memory sizes from 8MB to 16MB for each bank (256MB if 16MB SIMMs work). Therefore, the Quadra 950 could have a total of 64MB when using the SIMMs currently available.

16MB SIMMs haven't been thoroughly tested on the Quadra 950, and therefore can't be listed as a possible configuration. The Quadra 950 can also use 60ns SIMMs, but Orwell is programmed for 80ns DRAM, so a 60ns SIMM wouldn't improve the speed. If one slot in a given bank is

filled, then all slots in the bank must be populated.

Note: When large amounts of DRAM are installed, the memory check upon startup is lengthy and can cause users to think that the computer isn't functioning. There is no software indication that the computer is running memory checks.

The Orwell IC contains registers that the system software uses to set the starting address of each bank of memory. At startup, the system software determines the sizes of the banks and assigns the bank starting addresses so that the banks occupy contiguous memory spaces, unlike that of the Macintosh IIci and IIsi, which have split memory maps.

ROM

The ROM in the Quadra 950 is soldered directly to the main logic board, and consists of two 4MBit ROMs at 150ns (each ROM is a 256K x 16 device)=1MB ROM. As with all instructions, ROM can be cached in the 040. The memory controller, Orwell, supports burst access to the ROM via the 68040 fake burst mechanism. This means that Orwell asserts Transfer Burst Inhibit (TBI) with TA for accesses to ROM, which can't be "bursted." This allows the 040 to try a burst, and then notice that it must do the accesses in four individual long words.

SCSI Controller ICs

In the Quadra 950, the SCSI bus is divided into internal and external buses, each controlled by its own NCR 53C96 device. The internal and external SCSI buses are logically connected, but electrically separate. The external bus is electrically isolated from the internal bus so that changes in external cabling and termination have no effect on the performance of the internal SCSI devices.

The cabling and termination of the internal SCSI bus are optimized so that the 53C96 that controls the internal bus can support data transfers at a faster rate -- up to 5MB/s (the maximum the chip can transfer is 6MB/sec). Earlier Macintosh computers were capable of a 3MB/s transfer rate.

NuBus Controller IC: YANCC

In the Quadra 950 computer, the interface between the system bus and the NuBus comprises three chips: the YANCC IC and two 16-bit transceiver ICs that are the same as the ones in the Macintosh IIci.

The YANCC IC maps certain system bus cycles to NuBus cycles and certain NuBus cycles to system bus cycles. The features of the YANCC IC include:

- Support for all types of single data transfers in either direction

- A buffer, one long word deep, for appended writes from the MC68040 to the NuBus

- Support for block move transfers between NuBus masters and main memory

- Support for pseudo-block transfers between the MC68040 and NuBus slaves

- Support for some new functions defined in the NuBus '90 specification

Unlike the NuBus controllers in previous Macintosh computers, the YANCC IC generates an interrupt when there is an error involving the write buffer. Software controls this interrupt by means of a control and status register in the YANCC.

Video Frame-Buffer Controller IC: DAFB

The built-in video hardware in the Quadra 950 computer provides high- performance graphics on all current Macintosh monitors. The video hardware is built around a video frame buffer controlled by the DAFB IC.

The video frame buffer comprises four banks of video RAM (VRAM); two of which are soldered onto the logic board. This minimum configuration (1MB soldered on) supports 16 bits per pixel on all Apple monitors up to 16 inch, and 8 bits per pixel on all Apple monitors. The basic VRAM configuration supports 24 bits per pixel on the 12-inch RGB monitor. The standard 1MB VRAM also supports NTSC and PAL monitors, using Apple convolution as well as VGA monitors. By installing VRAM SIMMs into the other two banks (four 256K VRAM SIMMs), the user can expand the frame buffer to support 24 bits per pixel for the 13-inch and 16-inch monitors.

Because the frame buffer in the Quadra 950 computer is connected directly to the system bus, which is now even faster than the Quadra 900, it speeds up all applications, even those that don't use QuickDraw. Given the faster clock speed, and the removal of wait states in the VRAM timing, the Quadra 950 frame buffer can perform graphic operations, such as scrolling, up to 50% faster than the Quadra 900 frame buffer.

The control registers in the DAFB IC and the frame-buffer VRAM are mapped into the memory locations that were assigned to NuBus slot $9 in earlier models.

Sound ICs: DFAC, Batman, and Sporty

The Quadra 950 computer uses a new sound system. Its features are similar to the features of the sound interface in the Macintosh LC and the IIsi. The features of the Quadra 950 sound interface include:

- ASC compatibility

- Ability to play 8-bit sound files

- 8-bit sound input

- Lower noise and distortion analog circuitry

Four Apple custom ICs provide the sound interface:

- DFAC: provides sound input and an anti-aliasing filter

- Batman: an updated version of the Apple Sound Chip

- Sporty: a custom IC that replaces the two Sony sound ICs

- External digital-to-analog converter (DAC)

The Digitally Filtered Audio Chip (DFAC) is an Apple custom IC that is also used in the Macintosh LC. The DFAC IC includes the anti-aliasing filter and analog-to-digital converter (ADC) for sound input. It also contains a digital filter for conditioning output data before it is sent to the DAC. The DFAC serializes the sound input information and sends it to Batman, where it is put into a FIFO, which software can read.

The Batman sound chip provides ASC compatibility and includes several important new features such as support for sound input, support for an external D/A converter, and large FIFOs which buffer playback and sound input samples. Batman doesn't support the wave table function which was available in the original ASC (this feature was not widely used and should only cause very limited compatibility problems). The Batman transfer acknowledge is generated by Relayer.

For sound output, an external DAC provides higher-quality sound than that generated by the PWM system used in earlier Macintosh models. The Sporty custom IC replaces the two Sony ICs used in earlier models and provides better sound quality (that is, less noise and distortion). Like the Sony ICs it replaces, the Sporty IC also contains digital attenuators. A separate amplifier with power output of 2 watts drives the larger speaker used in the Quadra 950 computer.

Last Modified: Feb 19, 2012

Additional Product Support Information

Macintosh Quadra 950: Expansion Slots

The Macintosh Quadra 950 computer has five NuBus slots and one PDS (processor-direct slot) line with NuBus slot $E and uses the same opening in the back. The use of a PDS card precludes the use of a NuBus card in slot $E.

This article has been archived and is no longer updated by Apple.

NuBus slots

NuBus in the Quadra 950 provides all the benefits found in the Quadra 900:

- Provides higher power

- Accommodates oversized NuBus cards

- Supports some of the NuBus '90 features

Higher Power

The power supply in the Quadra 950 computer is designed to provide additional current on the +5V outputs for the NuBus slots, compared with the current specified in "Designing Cards and Drivers for the Macintosh Family," second edition. The Quadra 950 has enough power to support a total of two 25-watt cards and three 15-watt cards.

Oversized NuBus Cards

Each NuBus slot can accommodate either a standard NuBus card or an oversized card. The oversized card is the same length as a standard NuBus card, but it is 2 inches taller. Each NuBus slot in the Quadra 950 computer includes a card guide; to install an oversized card, the user removes the card guide.

NuBus '90 Features

NuBus '90 is the 1990 proposal for revision of the IEEE standard for the NuBus (IEEE STD R1196-R-1990). Apple has a representative on the panel designing the new standards, and has had since its inception. The specifications for NuBus '90 are incomplete and still under development, but Apple has implemented the portion of the specifications that are completed. Apple will be updating the implementation as the specifications expand and stabilize. The NuBus slots in the Quadra 950 computer provide the following new features described in that proposal:

- Low current at +5 V is available on the new STDBYPWR pin when main power is off and the AC cord is plugged in.

- New signals /TM2, /CLK2X, and /CLK2XEN support block transfers at double the standard rate (20 MHz). The Quadra 950 computer allows double-rate block transfers between NuBus cards, but doesn't support double-rate transfers to or from the main memory (this remains at 10 MHz).

- NuBus '90 defines new signals SB0 and SB1 for a serial bus on the formerly reserved pins A2 and C2. The serial-bus signals are bused and terminated, but the main circuit board doesn't drive them.

- NuBus '90 defines new signals /CM0, /CM1, /CM2, and /CBUSY to support a cache coherency protocol. Pins on the NuBus connector are assigned to those signals, but the Quadra 950 system doesn't support them.

Processor-Direct Slot

For maximum performance, the processor-direct slot (PDS) is connected directly to the MC68040 microprocessor by way of the system bus. Possible applications for a PDS expansion card include cache memory, a video frame buffer, a DMA-based I/O controller, expansion memory, or even an additional MC68040 microprocessor. When a PDS card is installed, slot $E is unavailable for a NuBus card.

A PDS card can have memory locations in the upper part of the RAM memory space or in the space assigned to NuBus slot $E. If the card uses slot $E addresses, it must decode all addresses in both the slot space and the super slot space, responding to any access to an unused location with a TEA on the processor bus to indicate an illegal address.

A typical PDS card maps into the NuBus space and works with the system software's Slot Manager. Such a card must contain a NuBus declaration ROM and must notify the NuBus controller that it is using the NuBus space by asserting (pulling low) the signal /PDS.SLOT.E.EN on the PDS connector.

WARNING: A PDS expansion card for the Quadra 950 computer must be designed to work with the MC68040 microprocessor; PDS cards designed for computers that use the MC68020 or the MC68030 won't work in the Quadra 950 computer.

A PDS card for the Quadra 950 computer has the same dimensions as a NuBus card and can include a back-panel connector. When the PDS card is installed, it occupies NuBus slot $E, reducing the number of available NuBus slots from five to four. Any PDS card designed to operate in the Quadra 950 must be capable of meeting the 33 MHz timing specification for the Motorola 68040. This requires shorter output delay times than the 25 MHz timing. Otherwise, PDS connector pinouts, size and placement are identical among the Macintosh Quadra 900, 700, and 950.

IMPORTANT: The signals on the PDS connector are connected directly to the MC68040 with no buffers. Therefore the address, data, and clock lines on a PDS card must present capacitive loads of not more than 40 pF. The control lines must present capacitive loads of not more than 20 pF.

Archived - AppleTalk Remote Access: Sample V.32bis Script with Comments

I have a new V.32bis modem that I want to use with AppleTalk Remote Access (ARA), but there's no script on the application disk that I can use with it.
This article has been archived and is no longer updated by Apple.
The following AppleTalk Remote Access (ARA) script for the Telebit T3000 modem is a good example of how to write a script for any given V.32bis modem.

- **Notes**
  This discussion assumes that you have access to the documentation for AppleTalk Remote Access and that you are familiar with the command syntax and scripting basics.
- The command syntax is in the AppleTalk Remote Access Modem Scripting Language Guide.
- You can order the guide from APDA at: 800-282-2732 (USA), 800-637-0029 (Canada), or 408-562-3910 (International).

```
! "Telebit T3000 Modem 11/11/91"
! 11/14/91 - Added a ton o' comments
! 11/23/91 - Cleaned up comments a little bit more,
! and added S11=50.
! 12/2/91 - Took S11 back out.
! 12/9/91 - Added the pinouts for the RTS/CTS cable to the comments
! Since you have to make a hardware handshaking cable.
! 1/16/92 - Add a bunch more comments about the cable.
! 3/30/92 - Added comments about the hang up sequence.
! 3/31/92 - Added sbreak in hangup sequence to speed things up.
! 3/31/92 - Added S38=3 to help ensure that the modem will be
! able to transmit all the data in its buffer (including
! the disconnect command for the remote modem!) before
! it hangs up.
! 4/2/92 - Changed S38 to 255. See notes below.
! 4/2/92 - Changed S51 to 254 in hang up sequence since 19200 is
! our DTE speed.
!
! Note the cable requirements when using a V.32bis modem. Since a lot
! of people do not have this cable, you should not use this approach when
! scripting for V.32 or slower modems.
!
! The cable requirement for using a V.32bis modem with AppleTalk Remote
! Access is a hardware handshaking cable. The Macintosh can be overrun
! with data when the modem is in high speed mode with compression enabled.
! If a standard cable is used, ARA senses it and doesn't allow the modem
! to connect at the high speed. It automatically drops down to 9600 bps.
!
! The correct cables can be purchased from many of the modem vendors.
!
! Cable needed to use AppleTalk Remote Access with V.32bis modems:
! Din-8 DB-25
! ----- -----
! 1 (DTR) 4,20 (RTS, DTR)
! 2 (CTS) 5 (CTS)*
! 3 (TxD-) 2 (TD)
! 4 (SG) 7 (SG)
! 5 (RxD-) 3 (RD)
! 6 (TxD+) Not Connected
! 7 (GPi) 8 (DCD)
! 8 (RxD+) 7 (SG)
!
! *Normally 2 (CTS) <-!6 (DSR) on other Macintosh cables.
!
!- One consequence of using this cable is that DSR (or DCD) from the modem
! is no longer connected to the Macintosh. This does not let your
! Macintosh communications software use the DSR (or DCD) signal to detect
```

```
! carrier loss. And, since the Macintosh Serial driver does not support
! the GPi input...you are sort of stuck, unless your communications
! software does use the GPi input, or Apple builds GPi support into the
! serial driver.
!
!- Since DTR and RTS are connected together, the modem must be configured
! to ignore DTR (usually the &D0; command) when using this cable with
! other communications applications. Otherwise, when RTS handshaking from
! the Macintosh is used, the modem will drop connection the first time the
! Macintosh de-asserts RTS.
!
!- If there is a need to use DTR to make the modem disconnect, RTS
! handshaking cannot be used to control the flow of data from the modem to
! the Macintosh. CTS handshaking (from the modem to the Macintosh) is
! available. This is what ARA does so it can force the modem to hang up,
! and at the same time the modem can signal the Macintosh to stop sending
! data. This assumes that the Macintosh will always be able to accept
! data from the modem. This will not be true if the Macintosh is talking
! to the modem at 57.6KBps with V.32bis & V.42Bis. There will be times
! when the Macintosh will need to signal the modem to stop sending data.
!
! In summary, with this cable:
!
! If you want to use RTS hardware handshaking, you cannot use DTR to
! control the modem. You will have to resort to other methods to coerce
! the modem to disconnect.
!
! If you want to control the modem with DTR, you cannot use RTS hardware
! handshaking so the Macintosh must be able to accept data from the modem
! at all times, or can recover if data is lost.
!
! In either case you can use CTS hardware handshaking so the modem can
! signal the Macintosh to discontinue sending data.
!
@ORIGINATE
@ANSWER
!
! Talk to the modem at 19,200 bps. The T3000 should auto-baud this
! unless the user has locked the port to a particular speed. If it
! is locked to a different speed, the user will need to change that.
!
serreset 19200, 0, 8, 1
!
! The idea here is to get the modem into a known state, and then change
! only the registers that are necessary to support the connection. Most
! of the time AT&F; will be sufficient, but some modems allow the user to
! change the F0 parameters. There isn't much that can be done to prevent
! this, but if the modem has any pre-configured configurations, and one of
! them sets hardware handshaking, use it.
!
! Recall the factory configuration
! F9 is the built in pre-configured setting for CTS/RTS handshaking on the
! T3000. Since it's possible for the user to modify F0 parameters, this is
! a little safer.
!
! AT&F9; sets:
! &C1; - DCD is on after connect
! &D2; - DTR on/off disconnects
! S58=2 - Use RTS/CTS flow control in full-duplex mode
! S61=1 - Go into command mode when receiving break from DTE (see
! @HANGUP for why the script cares about this).
!
! Every time the script needs to send commands to the modem, the strategy
! is: Clear all matchstrings, look for specific responses, and loop around
! a couple of times. Later in the script, certain loops pause 50-70
```

```
! seconds, such as when the script dials a number and is waiting for a
! connection. Other times, the script pauses 3-5 seconds and loops around.
! When the script is sending commands to the modem, it should expect to
! see a response within a couple of seconds, so it's best to look quickly
! and exit with an error in a reasonable amount of time so the users do
! not wait a for a long time before they are notified that they may need
! to power-cycle/reset the modem. When the script is dialing out over a
! telephone system or PBX, it needs enough time to make a connection. In
! short, if it's communicating to a modem, loop in 3-7 second increments.
! If the script is waiting for something other than a modem response (like
! a completed connection or terminal server) it may need 60-70 seconds.
!
! If the defaults cannot be set, jump down to label 59, which exits and
! asks the user to check out the modem. If an AT&F; command will not be
! accepted, the modem may be hung and needs to be manually reset.

jump 1
!
! The script was able to get the modem into a default factory state. Now
! set the basic hardware type configuration such as command echo, hardware
! handshaking, and DTR control. If the &F9; command had not set up
! handshaking this is where it would be done. It's not desirable to
! create one long command string with everything on it because some modems
! cannot handle a long command string, and long strings are harder to
! debug. It's easy to enter an incorrect S-register value. For the most
! part, the following commands are probably common across a lot of modems,
! but always look up the commands in the modem manual.
!
! Next, Set up the configuration: drop connection after losing DTR
! Turn off auto answer and command echo.
!
! &D3; - DTR on/off resets modem
! S0=0 - Don't answer calls
! E0 - Turn command echo off

!
! Now that the modem hardware & flow control parameters are set, make sure
! any protocol negotiation is disabled, and issue any modem specific
! features here. Make sure that MNP4/V.42, and MNP5-10/V.42bis
! negotiations are disabled. By the way, some V.32/V.32bis modems have an
! option to disable Trellis error control, which is part of the physical
! layer modulation. This is not the same as MNP/V.42, and you do not want
! to disable it!
!
! Make sure that the modem is configured so it does NOT require error
```

```
! control to complete a link. ARA 1.0 does all error correction/data
! compression in software. All ARA wants is the fastest raw data pipe it
! can get. If the script spends time trying to negotiate some error
! control, the modems and/or Remote Access may time out.
!
! Also note the S38 configuration. It is noted later in the script that
! it is desirable to ensure that the modem's buffer has transmitted all of
! its data before it actually hangs the modem up. This ability appears to
! be implemented on a lot of modems.
!
! This set of commands is going to be implemented differently on different
! vendors V.32bis modems. In this example, Telebit uses S registers.
! Other modems may use S registers (but different registers), or \\
! commands, or % commands; you get the idea. (Did I mention that you
! really, really want to have your modem manual handy?)
!
! It is important that the modem is configured so that it returns
! the connected speed, NOT the DTE speed. The script needs to know what
! the real line speed is in order to set ARA's internal timers. Some
! modems don't have the option to display the line speed. In that case
! the performance of the connection may not be optimal.
!
! Next, disable MNP and error control
! Turn on internal buffering (for V.32bis), set the delay before
! disconnect, and extended result codes (CTS/RTS flow control was set when
! we issued &F9;, so it is not necessary to do it again).
!
! S180=0 - Turn off all error detection/correction (ARA does MNP and
! compression itself. It needs these turned off in the modem).
! S181=1 - Turn *on* DTE <-> line buffering if there is no error control.
! Since the modem will be talking to the
! Macintosh at 19,200 bps no matter what speed
! it connects at, this needs to be on.
! S38=255 - Wait until the modem's buffer is clear OR the other modem
! disconnects after an ATH is issued before dropping the line.
! This is done to ensure that all any data in the modem's buffer
! has been transmitted to the remote modem before it
! disconnects. If the remote connection does not receive the
! disconnect packet (usually the last one sent) it could take up
! to 45 seconds for the remote connection to timeout and
! disconnect.
! X2 - Issue extended result codes. This will display busy, connect XXX,
! and so on. X2 will say "CONNECT XXX" Where XXX is the line speed
! (as opposed to DTE speed). This is so ARA can determine what speed
! the modems are communicating at for timing.

note "Dialing ^1" 3
write "ATDT^1\\13"
!
! Be aware that different modems will have different format strings
! to return connection results. You need to understand the different
! possible strings and set this area (and then answer area at label 31) to
! the appropriate value. Also, remember that the modem was configured to
! return the connect speed if possible (The X2 command up at label 5).
! It's also useful if the modem can return busy, no dialtone, etc. since
! the script will be able to exit quicker and let the user know what is
! going on.
!
! Also note that the script waits at the bottom of label 9 for a 70
! seconds, rather then looping around. Why? Well, if the script
! re-issues the dial command too soon, that would cause the modem to hang
! up. At this point the script should wait a reasonable amount of time
! for one of these strings to return from the modem and take the
! appropriate action.

!
! What is userhook 1 doing in label 32? Here's the idea: Either this
! script controls a server that is waiting to answer the telephone, or
! it's waiting for a callback to a connection that was initiated.
! AppleTalk Remote Access does a "passive" listen on the serial port (via
! the Serial Port Arbitrator) so that other communications applications
! can use the serial port when ARA is not using it. When a call comes in
! for a server or callback, there will be about 5-14 seconds while the
! modems negotiate the connection. What would happen if a communications
```

```
! application on this Macintosh wanted to use the serial port during that
! time? Both connections would fail. The userhook 1 command tells ARA to
! mark the serial port in use. When that happens, applications that want
! to use the serial port will be told it's busy, and the incoming
! connection can complete. With that in mind, the strategy below is:
! When the modem receives a ring, jump to label 32, issue the userhook 1
! command, then jump back up to label 31, wait for the connect result code
! and continue processing the script.
!
@LABEL 31

!
! Hang up the modem
! Note: Why try to enter command mode and hang up the line with ATH, when
! de-asserting DTR will always work, and it is used as a last resort
! anyway? If DTR is used immediately, the modem will hang up
! immediately. This can have the ill effect of hanging up before
! all the data in the modem's internal transmit buffer has been
! sent. It is very desirable to have the last byte of data sent
! make it out of the modem and across the phone line. Typically,
! the last packet sent is the disconnect packet, and if the other
! side misses this packet, it may have to wait up to 45 seconds to
! hang up.
!
```

```
@HANGUP
@LABEL 60
settries 0
HSReset 0 0 0 0 0 0
@LABEL 61
!
! Here's the basic logic for hanging up: If the modem can be configured
! to enter command mode when it receives a short break, send a short
! break. Send an ATH to hang the line up (and if possible up in the
! configuration, set the modem to attempt to send all the data in the
! buffer before it disconnects). If that fails, it must still be on
! line, so send the escape sequence to try to drop into command mode.
! Don't issue a short break again since it did not work the first time.
! If that fails, de-assert DTR which should force the modem to hang up
! (make sure the cable is wired properly for this option!).
! If +++ worked, don't send a short break again; flush the serial port
! buffer in case the ATH failed due to any stray data hanging around.
!
! How was this sequence determined? Trial and error. Different vendors'
! modems behave differently when disconnecting. Some modems will not
! enter command modem during a disconnect, and the only option is to
! de-assert DTR to force them to reset. That's why DTR resets the modem
! instead of just disconnecting it! Experiment with this sequence to make
! it function, but it should work with the majority of the modems
! available.
!
! Now, since the Telebit modems will drop into command mode when they
! receive a short break (S61=1), issue one here. This will speed up the
! disconnect sequence by about 5-6 seconds. Then continue on with normal
! AT disconnect processing.
!
Sbreak
!
! Wait a brief amount of time (1/2 second in this case) so the modem will
! be ready to accept the ATH command. Pause 1 actually seems to work ok,
! but it's set to 5 just to be safe.
!
pause 5
write "ATH\\13"
matchclr
matchstr 1 63 "NO CARRIER\\13\\10"
matchstr 2 63 "OK\\13\\10"

jump 61
!
@LABEL 62
! Pause 1 second to ensure we meet the escape time delay
pause 10
Flush
write "ATH\\13"
matchstr 1 63 "OK\\13\\10"
```

```
matchstr 2 63 "NO CARRIER\\13\\10"
matchstr 3 63 "ERROR\\13\\10"
matchread 30
jump 61
!
! Now that the modems have disconnected, and the script has possibly reset
! the modem, restore the factory settings. Remember, the script may have
! hung up the modem in order to get ready for a callback, or it wants to
! get ready to wait to answer a call again.
!
! recall the factory settings. Use &F9; again (see note at top of script)
!
@LABEL 63
matchclr
matchstr 1 64 "OK\\13\\10"
pause 15
write "AT&F9;\\13"
matchread 30
!
! Now turn off auto answer if it was turned on to answer a call. If this
! script controls a server, the @ANSWER sequence will be called by ARA.
! One other thing to watch out for here is that some modems expect to
! talk to the DTE at the last connected speed. If this is a V.32bis
! modem and it just finished a connection with a 2400 baud modem, it
! doesn't necessarily want to talk at 2400 the next time! Some modems
! don't exhibit this behavior, so play with it and see what happens.
! Finally, since it successfully hung up, exit the script with a result
! code of 0 to let Remote Access know everything worked.
!
! Turn off auto answer, set S51 so modem will check interface speed on next
! connection. If this is not done, the modem will not try to autobaud,
! with the result being it exits the script with an error.
!
! S51=254 - Autobaud (19200 bps default)
! S0=0 - Don't try to answer the phone
!
@LABEL 64
pause 5
matchstr 1 65 "OK\\13\\10"
write "ATS51=255S0=0\\13"
matchread 20
!
@LABEL 65
exit 0
```

For more information about using V.32bis modems with AppleTalk Remote Access, use "AppleTalk Remote Access AND V.32bis" as a search string.

DTR Off

Off - Open
On - Closed

Pinouts:

(Order numbers A9M0303P and A9M0305P)

DB-25
Connector Signal Name
1 ..... Frame Ground
2 ..... Transmit Data (Tx)
3 ..... Receive Data (Rx)
4 ..... Request to send (RTS)
7 ..... Signal Ground
14 ..... Fault
20 ..... Data Terminal Ready (DTR)

Pin Out Explanation

Pin 1 (FG) is used to provide a common ground reference for the electronics in both the ImageWriter and the device it is connected to. This pin is sometimes not connected. If there is an intermittent problem which can be cured by turning the IW off and on again, check the cable to see if pin 1 is connected.
Pin 2 (TD) conveys serial data sent from the ImageWriter (EXAMPLE: If the IW's DIP switches are set for XON/XOFF flow control protocol then this line would send characters to the connected device to tell it when to start and stop transmission. This is one of the pins that may need to be crossed over if the peripheral device is a DTE. A modem eliminator cable can perform this crossover.

Pin 3 (RD) receives serial data sent from the device the ImageWriter is connected to. This is one of the pins that may need to be crossed over if the other device is a DTE. A modem eliminator can perform this crossover.

Pin 5 (RTS) is asserted whenever the ImageWriter is powered on.

Pin 7 (SG) provides a common electrical ground level that the devices can reference the RS232 signals to. This pin should always be connected.

Pin 14 (Fault) notifies the device connected to the ImageWriter that the ImageWriter has been deselected (the SEL lamp goes out). This can be due to normal events such as you pressing the SEL switch or paper running out or it can be due to a problem such as the ImageWriter's microprocessor experiencing a glitch.

Pin 20 (DTR) becomes active when the ImageWriter is ready to go on line. If the IW's DIP switches are set for the DTR flow control protocol, this line will go on and off to tell the connected device when to start and stop transmission. This is one of the pins that may need to be crossed over if the device connected is a DTE. The modem eliminator cable can perform this crossover.

AppleLine: How To Use With an Apple IIe or Apple IIc (10/94)

The following information has only been partially verified for the 3274-2.2 ROMs. Though this setup should work with the newer ROMs, this has not been confirmed.

This article has been archived and is no longer updated by Apple.
Hardware Configuration:

Apple IIe
Super Serial Card in Slot 2. The jumper block should be set to terminal.
Straight thru cable - 590-0037
or
Apple IIc
Apple IIc-ImageWriter/Scribe printer cable.

Gender changer - 590-0214
Appleline - 699-0239 with version 2.2 of the ROMs.
Appleline wall mounting power supply - 970-0950
(optional - Loop Back Connector - 970-0879)

Software Configuration:

ProDOS 1.1.1
Apple Access II v 1.1
Set Access II as follows:
Terminal Characteristics
"Set ANSI Mode"
"Do NOT Send LF After CR" - for Supervisor mode
or
"Send LF After CR" - for 'On-Line' mode
"7 Bits per Character"
"Enable XON/XOFF"
"Normal Video"
"Full Duplex"
"No Wraparound"
Set Speed - "2400 baud"
Set Parity - "Even"

Appleline Configuration:

Terminal Type....."VT100"
Baud Rate....."2400"
Parity....."Even"
Autobaud....."Enabled"
Speed Indicator....."Disabled"
Modem type....."Local Connect"
Auto Logoff....."Disabled"
Special Terminal Capability..."None"
24/25 Line Automatic Toggle..."Disabled"

Notes

1- Set Access II for 2400 baud. 4800 & 9600 seem to overrun it.

2- The autobaud sequence is OpenApple-B Return (OA-B Return).

3- If you use 8 bits per character, set parity to None in Access II and on the Appleline.

For more information on VT-100 keypad sequences, see Apple Access II

(030-0923-A, copyright 1983), Appendix i, pp 165-166.

4 - The mapping for an Apple IIe or IIc running Access II to IBM 3278 Keys is as follows (not checked):

3278 Key	Press
PF1	Esc 1
PF2	Esc 2
PF3	Esc 3
PF4	Esc 4
PF5	Esc 5
PF6	Esc 6
PF7	Esc 7
PF8	Esc 8
PF9	Esc 9
PF10	Esc 0
PF11	Esc - (minus)
PF12	Esc =
PF13	Esc !
PF14	Esc @
PF15	Esc #
PF16	Esc $
PF17	Esc %
PF18	Esc ^
PF19	Esc &
PF20	Esc *
PF21	Esc (
PF22	Esc)
PF23	Esc _ (underscore)
PF24	Esc +
* NEW LINE	OA-Return
ENTER	Return
TAB	Tab
BACK-TAB	Control-OA-K
HOME	Control-\\
LEFT CURSOR	Left-Arrow or Control-H
RIGHT CURSOR	Right-Arrow or Control-U
DOWN CURSOR	Down-Arrow or Control-J
UP CURSOR	Up-Arrow or Control-K
PA1	Esc [
* PA2	Esc]
* DUP	Control-OA-U
* FM	Control-Y
ATTN	Control-A
* SYS REQ	Control-B
* CURSR SEL	Control-D
CLEAR	Control-E
ERASE INPUT	Control-L
ERASE EOF	Control-F
* PRINT	Control-P
* IDENT	Control-V
* TEST	Control-T
RESET	Control-R
a DEV CNCL	Control-R

INSERT Control-]
b DELETE Delete

* NOT TESTED

- According to the documentation (See Appleline Users Manual, Appleline Part II: Guide to Lisa, Chapter 2, p65) Control-X should give a DEV CNCL function, but where DEV CNCL is needed (according to the systems types there) Control-R works. This is the same code as is used for the RESET function.

- According to the documentation (See Appleline Users Manual, Appleline Part II: Guide to Lisa, Chapter 2, p65) Control-underscore should work. Instead it locks Appleline.

Macintosh PC Exchange: Workaround to Get AFE to Recognize DOS

- **Last Modified:** October 04, 2008
- **Article:** TA28021

- **Old Article:** 10303

This article has been archived and is no longer updated by Apple.

When I have Macintosh PC Exchange installed (or DOS mounter, AccessPC, and so on), Apple File Exchange (AFE) or MacLink Plus PC don't recognize DOS disks as DOS disks. Because Macintosh PC Exchange makes a PC disk appear as a Macintosh disk, AFE thinks it's a Macintosh disk and won't display the MS-DOS menus.

This is how we would expect AFE and Macintosh PC Exchange to behave.

The workaround for AFE is as follows:

1) Insert the MS-DOS disk.

2) From the "Mac to Mac" menu, select the "Other translations..." menu item.

3) Select the translator you want to use.

4) Make sure the "Add" radio button is selected and click "OK".

5) Repeat the process for all of the translators you want to use.

This will add the translator(s) to the "Mac to Mac" menu. Now all you have to do is select the translator(s) so it's checked in the menu and you will be able to use it.

Alternatively, you can disable Macintosh PC Exchange during the session with Apple File Exchange or MacLink Plus PC.

Macintosh: PDS Expansion Slot Differences

Are all Processor Direct Slot (PDS) connectors in various Macintosh models different? If so, what are the differences?
This article has been archived and is no longer updated by Apple.
Macintosh computers use two main types of hardware expansion:
* A single processor-direct expansion slot
* NuBus expansion slots

A single PDS is used by the Macintosh SE, SE/30, LC, LC II, Portable.

Models that provide both PDS and NuBus slots are the Macintosh IIci, IIfx, Quadra 610 (smaller, 7-inch NuBus slot), 650, 700, 800, 900, and 950, the Power Macintosh 7100 series, and Power Macintosh 8100 series.

Note: The Macintosh Classic, Classic II, and PowerBook computers have no hardware expansion slots, although they do provide for internal memory expansion.

A PDS implementation brings the microprocessor address, control, and data lines, along with clock, power, and a few model-specific signals, to a single expansion connector on the main logic board. Apple uses the PDS expansion interface on compact, or small-footprint Macintosh computers such as the Macintosh SE, the SE/30, LC, or any design for which NuBus is inappropriate. The Macintosh II class of computers, such as the IIfx and the Quadras, also include a PDS connector, but their primary means of expansion is the NuBus interface.

Apple attempts to limit the number of PDS configurations available without compromising the Macintosh design, but since the PDS expansion interface is an extension of the microprocessor, the configuration of the slot connector will change whenever a newer, more powerful microprocessor is used.

68000 and 68020 PDS Interfaces
The Macintosh SE was the first Macintosh offering a PDS expansion. The SE uses a 96-pin expansion connector. The 96-pin expansion connector on the Macintosh Portable is physically identical to that of the SE, but the pinouts and signals available are different. The 68020 PDS interface in the LC is also a 96-pin connector that is physically identical to that in the SE and Portable; however, the pinouts and signals are different.

68030 PDS
Both the SE/30 and the IIfx have 120-pin connectors. Once a PDS adapter card is installed in the IIsi, it also provides a 120-pin PDS expansion connector. Whereas most of the signals on the 68030 PDS connector are the same on all models, a few signals are computer-specific. Therefore, PDS cards developed to take advantage of computer-specific signals may not work in other "030" Macintosh computers.

Macintosh LC and LC II
The 68020 PDS in the Macintosh LC uses a Euro-DIN 96-pin connector, as does the 68030 PDS in the LC II and the LC III. The PDS in LC-class models are electrically and physically identical.

The PDS used in the Macintosh 630 family is similar to that used in the LC, many PDS cards designed for the LC family will work in a Macintosh 630 class computer with the exception of the IIe Card.

68040 PDS
The 68040 PDS in the Macintosh Quadra is a 140-pin connector. The Macintosh Quadra's PDS cards aren't compatible with other Macintosh computers, and vice versa. The connectors are physically different, and the signals and logic were designed to support the 68040.

AV Macintosh computers
The 660AV and Quadra 840AV do not have a PDS connector. The 660AV has only a NuBus adapter slot.

Macintosh 630 family computers
The Macintosh 630 family, including the LC 630 and the Performa 63x computers, have three unique internal expansion slots. They include:

* One 114-pin LC compatible PDS
* One 112-pin communication port for modem and ethernet
* One 60-pin video-in slot for real time video display, capture and overlay

To verify that a particular third-party product is compatible with a specific Macintosh, we recommend you check with the supplier of that product.
Additional technical information on PDS is documented in these manuals:

Designing Cards and Drivers for the Macintosh Family
Guide to the Macintosh Family Hardware

Additional Product Support Information

Archived - Apple File Exchange: Contrasted to File System Translators

What are the technical differences between translating AppleWorks files with AFE, and using the GS/OS HFS FST to copy them to an HFS disk? I tried this, and got the following results:

AFE:
Type:1A__
Creator: pdos
1 resource, type pdos, size 10 bytes, ID 0

HFS FST
Type: p___
Creator: pdos
No resource fork present.

The purpose of this is to translate some AppleWorks files into GreatWorks or ClarisWorks using the XTND translators. If I translate them with AFE, everything works as intended. Why doesn't it work with the HFS FST, and why didn't the creators of the FST make it produce the same results as the previous translation standard (AFE)?
This article has been archived and is no longer updated by Apple.
The most important difference between AFE and any FST is that AFE is a file CONTENT translator, while FST (File System Translator) is a file SYSTEM translator.

A file translator does the following:

* Changes any filetype-specific information.
* Translates the specific information into a different layout.
* Adds any needed datatypes or header information.
* Possibly eliminates unneeded data.

This is specific to content of individual files, such as converting AppleWorks documents to ClarisWorks documents.

FST, on the other hand, translates the file system, including the following:

* Directory structures
* Subdirectory structures
* File types
* Block structures
* Other elements of the filing system

An FST DOESN'T translate the contents of an individual file. An FST DOES allow a foreign file system to reside on a native computer. For example, the Apple IIGS Finder desktop can display Macintosh HFS diskettes.

The results obtained are in line with each of the procedures. Translating the file contents from ProDOS to Macintosh OS requires adding some items, such as the resource fork and a specific file type. Generally a program that translates the contents of a file will also add a file type. This often allows double-clicking the translated file to open the file and application.

The contents of a file aren't touched when copying a file while an FST is in use. In the case presented, the 'p___' type is a generic type representing "some type of (unknown) ProDOS file."

AFE is an appropriate procedure for translating the contents of a file from one application format to another application format. FST is an appropriate method for allowing a disk from one operating system to mount while using a different operating system.

Thinking of FSTs as the "current translation standard" and AFE as the "previous translation standard" is an incorrect approach to understanding the purpose of these two entirely different operations. The creators of FST didn't have anything close to AFE in mind when they began to design their product. Their intention was to translate the filing system information, not the file contents. AFE was designed to translate the file contents, not the system of filing.

Macintosh PC Exchange: Mapping Database Files (9/94)

- **Last Modified:** September 02, 1994
- **Article:** TA28104

- **Old Article:** 10444

Does Macintosh PC Exchange's extension mapping capability include the ability to map database files?

My guess is that I can set it up to open FileMaker, 4D, and so on, for files with the extension .dbf. But will it work? Are there applications on both or all three platforms (Macintosh, DOS, Windows) that will recognize and properly open files with this extension in the same way that Excel, Lotus, and so on, can open WKS files?

The facility of mapping file types to a complementary file type on the Macintosh doesn't make Macintosh PC Exchange a file translation utility. You must be careful to specify the correct type of document that the Macintosh application will support. If you are unsure of which document type, use TEXT or launch the application and then choose the Open command from the File menu.

To our knowledge, FileMaker Pro version 2, Omnis 7, and FoxBase can open the data files of their equivalent Windows or DOS applications.

MacTerminal 3.0: Installation with System 7.0.1

I attempted to install MacTerminal 3.0 on a Macintosh II running System 7.0.1. This was a version I received about a year ago, that didn't mention System 7. All examples and instructions were keyed to System 6.

During the first floppy disk installation procedure, it flagged the Communications Toolbox as already existing on the target disk. But when installing the second floppy, it complained because it didn't find a Communications Toolbox folder where it expected to find or put various tools unique to MacTerminal 3.0.

I created a Communications Toolbox folder in my System Folder, and manually copied the tools from the floppy disk. This didn't work when I tried to run the application -- it simply said it couldn't find any tools.

How do I resolve this problem?

This article has been archived and is no longer updated by Apple.

Here's how to install MacTerminal 3.0 on System 7.x:

The Installer on Disk 1 of the MacTerminal 3.0 package installs the Macintosh Communications Toolbox. Since the Macintosh Communications Toolbox is built into System 7.x, you don't need to run the Installer.

1) Remove the Communications folder you created manually. In System 7.x, the Communications Tools reside in the Extensions folder in the System Folder. Drag these Tools from Disk 2 directly to the Extensions folder, or to a closed System Folder, and System 7.x will put the Tools in the Extensions folder.

2) Create a new folder called MacTerminal 3.0 on your hard disk, and drag the MacTerminal application and sample session documents from the MacTerminal disk to this new folder.

Additional Product Support Information

SNA■ps: Compatibility with Other Apple Products

What is the compatibility of SNA*ps with other Apple products?
This article has been archived and is no longer updated by Apple.
SNA*ps stands for Systems Network Architecture protocols and service, and is a family of applications that provide Macintosh users with integrated access to IBM mainframe (System/370 and System/390) and mid-range (AS/400 only) systems. SNA*ps 3270 or SNA*ps 5250 is end-user application software that presents the user with one or more 3270 or 5250 terminal sessions. It's designed to present the user with a text-based interface to applications, data, and services. The SNA*ps Gateway is server software that provides a network access to IBM mainframe and mid-range systems. It's designed to serve as an IBM gateway for multiple Macintosh computers attached to AppleTalk networks.

The SNA*ps 3270 application, which is included in both the SNA*ps 3270 and SNA*ps 3270 GC (gateway client) packages, will run on the Macintosh Plus and later systems. The SNA*ps Gateway application runs on one of the three Apple NuBus cards, and so requires any Macintosh II or Quadra system that incorporate NuBus. One caveat: the SNA*ps 3270 application includes support for certain connections (CUT and NLCA) on the Apple Coax/Twinax Card, which also requires a Macintosh II or Quadra computer.

The SNA*ps 5250 application software works with the Apple Token Ring 4/16 NB Card or Apple Serial NB Card installed in any Macintosh II or Quadra (NuBus capable) computer and supports directly connected or AppleTalk distributed 5250 sessions. SNA*ps 5250 sessions are distributed over AppleTalk allows SNA access for any Macintosh system connected to an AppleTalk network. SNA*ps 5250 also supports TCP/IP connections to an AS/400 for display support only. SNA*ps 5250 was recently enhanced to support AppleTalk Direct to the AS/400 using the IBM supplied AppleTalk ADSP stack.

SNA*ps requires Macintosh system software 7.0 or later.

A/UX doesn't support the SNA*ps 3270, SNA*ps 5250 and SNA*ps Gateway software at this time.

Ethernet supports SNA*ps, but only for connections between Macintosh clients and SNA*ps Gateways over AppleTalk networks. Ethernet is also supported to the AS/400 using the AppleTalk Direct solution. The connection between the SNA*ps Gateway and the mainframe currently must be either coax, SDLC, or Token Ring.

SNA*ps will run on the Apple TokenTalk NB Card (Apple's earlier 4M/bps Token Ring product) for SNA*ps 3270 GC via AppleTalk, SNA*ps 3270 single user full function SNA product (up to 5 sessions), and the SNA*ps 5250 single user full function SNA product (up to 5 sessions). Since you can't expand the MCP RAM on the TokenTalk NB Card beyond 512K, it is NOT recommended to run the SNA*ps Gateway products. Also, because of RAM limitations neither SNA*ps 3270 single user or SNA*ps 5250 single user products can run at the same time as TokenTalk.

SNA*ps will run on the Apple Token Ring 4/16 NB Card and an Apple Serial NB Card, and as a rule of thumb, a Serial or Token Ring card running SNA*ps gateways need 1MB. If multiple host connections are used (for example more than one host AS/400 and 3270 mainframe) at the same time than 2.5MB is suggested.

SNA*ps supports IBM's NetView network management. The NetView alerts supported are listed in Appendix E of the SNA*ps 3270 User's Guide (packaged with SNA*ps 3270 and SNA*ps 3270 GC). You can print directly from the IBM mainframe to a local Apple (or compatible) printer. The SNA*ps 3270 single user, SNA*ps 3270 GC, SNA*ps 5250 single user, and SNA*ps 5250 GC packages include an application called SNA*ps Print which allows you, for example, to send host output directly to a LaserWriter attached to your AppleTalk network.

The following is a partial list of third-party client software that can use the SNA*ps Gateway to access IBM hosts:

* Legent Corp. MacXCOM6.2
* ConnectivitÄ "Both."
* Tangram Systems AM:PM
* ASC asc3270
* Andrew Corp. TokenAxcess
* CEL Software Blacksmith
* Data Access Language (DAL) clients such as Brio DataPrism and DataPivot
* Microsoft Excel
* ACI US, Inc. 4th Dimension
* Fairfield Software ClearAccess
* Andyne GeoQuery

You can develop custom applications that use the SNA*ps Gateway services in C, Pascal, or Assembler. The SNA*ps Gateway supports both 3270, 5250 and APPC client application developments through Applications Programming Interfaces (API). These APIs are available from Wall Data directly. You can purchase the SNA*ps APPC Developer's Kit v1.0 and Apple 3270/5250 Developer's Kit v2.0.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

Additional Product Support Information

System 7: Key Combination Shortcuts and Tips

- **Last Modified:** October 04, 2008
- **Article:** TA28141

- **Old Article:** 10517

This article has been archived and is no longer updated by Apple.

This article includes (in alphabetical order) the keyboard/mouse combinations you can use with System 7.5. Many of these tips are documented in Finder Shortcuts, under Balloon Help.

Note: This article applies mainly to System 7 and the computers that would likely be running this version of system software. For additional (and newer) information, see the following Tech Info Library articles:

- Article 24881: "**Macintosh: Using Command-Option-Shift-Delete To Start Up From CD**"
- Article 58068: "**Mac OS 8.5: Keyboard Shortcuts**"

Alphabetize Icons in a Window

1. Activate the window you want to alphabetize.
2. Choose "By Name" from the "View" menu.
3. Choose "Select All" from the "Edit" menu.
4. Drag all files to the icon that represents the active window.
5. Choose "By Icon" from the "View" menu.

Bypass Set Start-up Device
To bypass the currently selected start-up device (except on a Quadra 700), start or restart the computer while holding down the Command-Option-Shift-Delete keys.

Cancel a Print or Copy Job
To cancel a print or copy job Command-. (period) keys.

Change "About This Macintosh"
To change the menu entry from "About this Macintosh" to "About the Finder" hold down Option while choosing the About document under the Apple menu in the Finder.

Clean Up Icons
Move all icons to nearest point on the grid and use one of these methods:

- Select Clean Up Window from the Special menu.
- Hold down the Option key and choose Clean Up By Name from the Special menu (this function alphabetizes and aligns icons to the grid and each other, the same as the previously explained Alphabetize Icons in a Window tip).

Note: Available in icon views only.

Align icon to grid
Hold down the Command key and drag then release the icon.

Close All Windows at Startup
To close all open windows on the desktop at startup, hold down the Option key. The folders remain closed on subsequent startups, unless you open them in the Finder.

Copy Selected Item to Clipboard

Use one of these methods:

- Select Copy from the Edit menu.
- Press the Command-C keys.

Cut Selected Item to Clipboard
Use one of these methods:

- Select Cut from the Edit menu.
- Press the Command-X keys.

Diacritical Marks (Typing)

Character	Key Sequence	Example
Grave Accent	Option-`-(any character)	lèvre
Acute Accent	Option-e-(any character)	école
Umlaut	Option-u-(any character)	fühlen
Circumflex	Option-i-(any character)	maître
Tilde	Option-n-(any character)	mañana
Cedilla	Option-c	façade

Note: With the exception of the Cedilla (which is a specific character), diacritical marks can be applied to almost any character. The correct sequence is to press the Option key and the key that activates the accent mark. The accent mark is applied to the next key pressed after this sequence.

Dialog Boxes (Using Functions)
Scroll through list in Open Dialog Box, use one of these methods:

- Click on the Up or Down arrows in the scroll bar.
- Use the Up or Down arrow keys on the keyboard.

Find a File Quickly in an Open Dialog Box
Type in the name of the file.

Note: The Delay until Repeat control in the Control Panel determines how many characters may be entered for a File search.

Select the First File in an Open Dialog Box
Use the Left or Right arrow keys on the keyboard.

Select the Last File in an Open Dialog Box
Press the tilde (~) key.

Switch Drives in an Open or Save Dialog Box
Use one of these methods:

- Click on Drive in the dialog box window.
- Press the Tab key.

Switch Keyboard Layout

- Press Command-Option keys. This causes the keyboard control panel under System 7 to switch between different keyboard layouts. System 7.5 installs many international keyboard layouts automatically when an easy install is performed.

Move Up File Hierarchy in an Open or Save Dialog Box
Click on the current disk icon or click on the directory name icon at the top of the dialog box to display the file hierarchy and select the one you want.

- Press the Command-Up arrow keys to move closer to the top-level directory.
- Press the Command-Down arrow keys to open a selected folder.

Disable Virtual Memory
Hold down the Command key at startup. Do not release the key until startup is complete.

Note: This disables virtual memory, but loads any system extensions. When you restart your Macintosh, virtual memory is turned on again.

Duplicate Item
Click on the item you want to duplicate and use one of these methods:

- Choose Duplicate from the File menu.
- Hold down the Option key and drag the icon to another folder.
- Press the Command-D keys.

Easy Access (Activating/Deactivating)

- Easy Access is a function designed especially for the disabled. This function lets you lock modifier keys (Command, Control, Option, Shift, Clear) without having to hold them down. Easy Access must be installed in the System Folder - Control Panels folder.
- **Activate Easy Access**
  Without moving the mouse, press the Shift key five (5) times.

Deactivate Easy Access

1. Without moving the mouse, press the Shift key five (5) times.
2. Press any two modifier keys simultaneously.
3. Press the modifier key(s) you want to use (do not press modifier keys simultaneously unless you want to deactivate Easy Access).
4. Press a nonmodifier key to activate a function.
5. Press the modifier key once to activate it for one function (the U icon should now appear with an arrow above it).
6. Press the modifier key twice to lock it down for more than one function (the U icon should now be filled with an arrow above it).
7. If the modifier key is locked, pressing it again unlocks it.

Eject Floppy Disk
Use one of these methods:

- Press the Command-Y keys or choose Put Away in the File menu.
- Drag the floppy disk icon to the Trash.
- Choose Restart or Shut Down from the Special menu.
- Start or restart the computer, and hold down the mouse button.
- Press the Command-Shift-1 keys to eject internal floppy drive 1.
- Press the Command-Shift-2 keys to eject internal floppy drive 2 or an external floppy drive.
- Press the Command-Shift-0 keys to eject any other floppy disk drives.
- Press the Command-E keys or choose Eject Disk from the Special menu - if no disks are selected, these function ejects all floppy disks. These functions leave a "greyed out" floppy disk icon on the desktop.

Last Resort
If the disk will not eject you can insert a straightened paper clip into the hole located on the right front of the floppy drive. However, this may damage the floppy drive.

Erase Disk
The Erase Disk command under the Special menu erases any selected disk except a write protected (locked) disk or the disk that contains the active operating system.

Erase Floppy Disk
To erase the selected floppy disk use one of these methods:

- Select Erase Disk from the Special Menu.
- Hold down the Command-Option-Tab keys while inserting the disk.

Extension Manager (System 7.5)
To bring up the Extension Manager at startup hold down the Space Bar.

Force Quit an Application
Press the Command-Option-Esc from within the application.

Use this feature with extreme caution. You should definitely not rely on this as a usual way to quit an application. It is useful in the event that you have unsaved work in other applications when your current application hangs. By using this feature, you can return to the Finder and save the work in your other applications. You should restart your computer after using this feature.

Get Info (Using Functions)

Information
Select the icon and then use one of these methods:

- Choose Get Info from the File menu.
- Hold down the Command-I keys.

Lock Item
Check or uncheck the Locked box in the lower left corner Get Info dialog box.

Change Application Memory Size
Click in the box located next to Preferred Size in the Get Info dialog box and enter the desired size.

Note: This function sets the amount of RAM that is allocated to an application when it is launched. It should not be set below the Suggested Memory Size number.

Hide Current Application When Switching to Next
Hold down the Option key while switching applications.

Keypad Mouse (Activate/Deactivate)
To set the keypad to control mouse movement, press the Command-Shift-Clear keys.

- The 1, 2, 3, 4, 6, 7, 8, 9, keys control movement and direction of the pointer.
- The 5 key is the mouse button.
- The 0 key locks the mouse button.
- The decimal point key unlocks the mouse button.

Note: This function does not work on a PowerBook without the Mouse Keys extension because there is no keypad.

New Folder Creation
Use one of these methods:

- Choose New Folder from the File menu.
- Press the Command-N keys.

Open a File or Folder
Click on the item you want to open and use one of these methods:

- Select Open from the File menu.
- Double-Click on the item you want to open.
- Press the Command-O keys.
- Press the Command-Down Arrow keys.

Paste From the Clipboard
After a Copy or a Cut, use one of these methods to Paste:

- Choose Paste from the Edit menu.
- Press the Command-V keys.

Postscript File Dump
This function lets you dump postscript files to disk rather than to the printer. The Postscript Files are labeled as Postscript X (where X is a number from 0 to 9). Background Printing must be turned off.

Note: This is for LaserWriter driver's previous to 6.3. Version 6.3 and higher support printing to a PostScript file

Postscript File Dump With Laserprep
Use one of these methods:

- Select Print from the File menu.
- Press Command-P. When the print dialog box appears, click OK. Immediately after clicking OK, press the Command-F keys.

Postscript File Dump Without Laserprep
Use one of these methods:

- Select Print from the File menu.
- Press Command-P. When the print dialog box appears, click OK. Immediately after clicking OK, press the Command-K keys.

Print
Use one of these methods:

- Select Print from the File menu.
- Press the Command-P keys.

Note: The command key function is not available at the Finder level.

Put Away Items
Choose Put Away in the File menu to place a selected item(s) back into its folder.

Quit
Use one of these methods:

- Select Quit from the File menu.
- Press the Command-Q keys.

Note: This command is not available from the Finder level. It is used to quit from an application.

Rebuild the Desktop

Hard Drive
Start or restart the computer while holding down the Command-Option keys.

Floppy Disk
Insert the floppy disk while holding down the Command-Option keys.

Note: If the floppy disk is the start-up disk, start or restart the computer while holding down the Command-Option keys.

Screen Dump
The files are saved to disk as Picture X (where X is a number from 0 to 9).

Pict File Screen Dump
Press the Command-Shift-3 keys.

Screen Dump to Imagewriter
Press the Command-Shift-4 keys.

Dump of Active Window to Imagewriter
Press the Command-Shift-Caps Lock-4 keys.

Note: The Imagewriter dumps do not work on networked printers.

Select All Items in the Active Window
Press the Command-A keys.

Startup From CD-ROM
Hold down the letter c key (lower-case only).

On a Power Macintosh or Macintosh 630 family (Performa 630, Performa 635, Performa 636, Performa 637, Performa 638, LC 630, and Quadra 630) computer, this directs the computer to startup from the CD-ROM drive instead of the hard drive or floppy.

Switch Startup Disk

1. Open the Startup Control Panel.
2. Select the device you want to use as your startup device.

Trash (Move Something To)
Drag the selected icon to the Trash Can

Delete Files Without Warning/Delete Locked Files
Hold down the Option key and drag a file to the Trash.

Turn Off Extensions (7.x)
Hold down the Shift key at startup until you see Welcome to Macintosh. Extensions off.

This disables, for this startup only, any items that load at startup, such as system extensions, control panels, or chooser extensions. It also disables virtual memory, and background printing with PrintMonitor, and turns the Disk Cache down to 16K (the minimum). It also prevents launching any items in the Startup Items folder.

Undo (the Last Editing Operation)
Use one of these methods:

- Choose Undo from the Edit menu.
- Press the Command-Z keys.

Windows (Manipulating)
To change size of awindow use one of these methods:

- Drag the size box.
- Click the zoom box to expand or reduce the size of a window.

Close Active Window
Use one of these methods:

- Choose Close from the File menu.
- Click the active window's close box.
- Press the Command-W keys.

Close All Windows
Use one of these methods:

- Hold down the Option key and choose Close from the File menu
- Hold down the Option key and click the active window's close box.
- Press the Command-Option-W keys.

Move Inactive Window
Hold down the Command key and drag on the inactive window's title bar.

Return to the Finder With No Windows Open
Hold down the Option key while starting or quitting from an application.

Reset the PRAM (7.x)
This operation resets parameters stored in Parameter RAM (PRAM).

Hold down the Command-Option-P-R keys during the restart sequence. Your computer beeps for a normal startup and then beeps again. When you hear the second beep, you may release the keys.

Many default settings for the Macintosh, such as serial port speeds, default application font, mouse scrolling rate, and so on, are stored in PRAM. It is sometimes useful to reset the PRAM to clear these settings and reset them to default values. Reselect any customized values for these settings.

After this operation, you may want to check your General control panel settings. If you have more than 8 MB RAM, also check your Memory control panel settings.

PowerBook: What To Do When It Won't Run On the Battery

- **Last Modified:** May 19, 1999
- **Article:** TA28156

- **Old Article:** 10572

This article has been archived and is no longer updated by Apple.
This article discusses why a PowerBook may not run on the battery, but will operate normally when plugged into AC power.

Products Affected

PowerBook, PowerBook G3

With the exception of the PowerBook models specifically mentioned below, the following troubleshooting information is relevant to all PowerBook models.

- Ensure battery is fully charged by using the proper power adapter for your PowerBook computer. If it is not charging, try a different AC outlet.
- Reseat battery to ensure it is making good, solid contact with PowerBook.
- Reset power manager. See TIL article 14449: "**PowerBook: Resetting Power Manager**".
- Try a different battery.
- If PowerBook provides multiple battery bays, try the battery in a different bay.
- Replace battery.

Additional troubleshooting for specific PowerBook models

PowerBook 100

- Check that the storage switch on the back of the computer next to the power connector is in the up position. This switch disables all battery power, but will allow you to use the unit with AC power.
- A fuse on the logic board may blow if the lithium batteries aren't removed before the unit is taken apart. It's also important that the unit is completely reassembled before the batteries are reinstalled. The logic board can be shorted out quite easily since the keyboard is a part of

the circuit. The symptom of the failure is that the PowerBook will run on the AC Adapter, but not on the battery.
- A blown fuse may be linked to a damaged or defective power adapter. In particular, the black insulating "O" ring on the tip of the adapter may be damaged and shorting out against the logic board. Replacement of the power adapter and the main logic board will fix the problem.

PowerBook 140, 160, 170, and 180

- On these computers, a blown fuse may be linked to a damaged or defective power adapter. In particular, the black insulating "O" ring on the tip of the adapter may be damaged and shorting out against the logic board. Replacement of the power adapter and the main logic board will fix the problem.

PowerBook 150

- The PowerBook 150 will show similar symptoms as the PowerBook 140 and 170 with a blown fuse. The unit will run with the AC Adapter connected but not from battery only. Additionally, the unit will not run from AC Adapter power if the battery is removed. Check the logic board fuse if it fails to run from battery.

PowerBook Duo

- Ensure the proper software is installed for the battery you are using. See TIL article 15315: "**PowerBook Duo: Battery Types and Compatibility**".

PowerBook 3400

- Have the battery gasket installed if necessary. See TIL article 30148: "**PowerBook 3400: Battery Gasket Installation**".
- The batteries for the 190, 3400, 5300, and PowerBook G3 all look similar but are not interchangeable. Refer to TIL article 24361: "**PowerBook G3, 3400, 5300, 190: Battery Interchangeability**".

PowerBook G3 Series

- Perform the PowerBook G3 Series battery adjustment. See TIL article 22211: "**PowerBook G3 Series: Battery Adjustment**".

The PowerBook G3 Series computers use Lithium Ion (LiIon) batteries that charge whenever the external AC adapter is connected. LiIon batteries have battery level indicator lights that tell whether the battery is fully charged, three-fourths charged, one-half charged, one-fourth charged, or empty. If one light is blinking then the battery is completely drained and need to be recharged. If all four lights are blinking then there maybe a problem with the battery.

AirPort 1.3: Using Computer-to-Computer Mode (IBSS)

- **Last Modified:** September 18, 2003
- **Article:** TA28186

- **Old Article:** 106140

You may quickly create a small network of AirPort-equipped computers without the use of a base station. AirPort 1.3 is also the first version of AirPort software to implement the IBSS standard.

Products Affected

AirPort

Computer-to-Computer mode allows you to quickly create a small network between two or more AirPort-equipped computers. Other IEEE 802.11-compliant devices may also join the network. A Computer-to-Computer network does not require an AirPort Base Station. If you have difficulties with larger numbers of devices joining a Computer-to-Computer network, you should set up one computer as a Software Base Station or get an AirPort Base Station.

Note: AirPort 1.2 and later provide software base station capability. A preview version of the Software Base Station was included with AirPort 1.1.

AirPort 1.3 meets IBSS standard

AirPort 1.3 should work with IBSS networks created by non-Apple devices. The Independent Basic Service Set (IBSS or "Ad Hoc network") is a collection of stations that are able to communicate with each other directly in a manner defined by IEEE standard 802.11b. In an IBSS network, there is no central collection point for data packets. IBSS networks can be created at any time and by any station. After a station creates an IBSS network, other stations may join it. The IBSS network exists as long as one of the stations that created or joined the IBSS is still available. If one of the IBSS peer stations is a router and the other peers have the router set as their default gateway, then wireless packets have the means to enter

and leave a wired network.

Setting up a Computer-to-Computer network

1. Choose the AirPort application from the Apple Menu
2. Choose Create Computer to Computer network from the Choose Network menu. A dialog box appears.
3. Enter the name of the network you want to create.

Figure 1 Computer-to-Computer dialog box

4. Click More Options if you wish to assign your Computer-to-Computer network a password or change the channel frequency away from the default of channel 1.

Figure 2 More Options

5. Your Computer-to-Computer network then becomes available to AirPort and compatible third-party devices within range of your computer, usually about 50 m.

Notes

1. If you are using a compatible third-party wireless device that has the ability to change channel frequency, check to be sure it is set to same channel as the computer that started the network.
2. In Computer-to-Computer mode, the signal strength meter in the AirPort portion of the Control Strip will always show three green dots.
3. If you are unable to use AirPort to access another AirPort-equipped computer, check to be sure that:
   - The TCP/IP and AppleTalk control panels on both computers are set to AirPort.
   - The target computer has started a Computer-to-Compter network, as illustrated in the AirPort application and Control Strip.
   - The computers are within range of each other (typically up to 50 m).
   - There are no sources of interference within range, such as a microwave oven or 2.4 GHz cordless phone.
   - File Sharing is turned on in both computers' File Sharing control panels if you wish to connect with the Chooser or Network Browser.
4. If you do not set up a password for your Computer-to-Computer network, the security of your computer is dependent upon the File Sharing privileges. If you have Guest access turned on, anyone with an AirPort equipped computer in a 50 m range could connect to your computer. A network without a password is not encrypted.
5. Wireless Internet access requires an AirPort Card, AirPort Base Station, and an Internet service provider, for which fees may apply. Some ISPs are not compatible with AirPort. America Online (AOL) works with AirPort software version 2.0 or later. For more information on AOL compatibility, see technical document 106591: "**AirPort: How to Use with AOL**." Range may vary with site conditions.

Archived - Mac OS X 10.0: Cannot Move a Queued Print Job to a Different Printer

A pending or unsuccessful print job may not be moved between printers in Print Center.
This article has been archived and is no longer updated by Apple.

Symptom

You are unable drag a pending or unsuccessful print job from one Print Center printer to another.

Solution

1. Select a different printer in Print Center.
2. Select the application from which you printed.
3. Print the job to the newly selected printer.

Mac OS X 10.0: Yellow Text While Starting up in Verbose Mode or Single-User Mode

- **Last Modified:** November 16, 2003
- **Article:** TA28194

- **Old Article:** 106193

You see yellow text when starting up in verbose mode or single-user mode.

Products Affected

Mac OS X 10.0

Symptom

Some of the text that appears in verbose mode or single-user mode is yellow.

Solution

You may safely ignore the yellow text unless you are a software developer. If you do not develop software, verbose and single-user modes are only needed when you are troubleshooting the computer for a startup issue.

A software developer working on a kext (kernel extension) should use the information in the yellow text to address potential issues with the kext.

TA28194_Mac_OS_X_10-0_Yellow_Text_While_Starting_up_in_Verbose_Mode_or_Single-Us

Archived - Mac OS X 10.0: Alert Message -9781 When Printing

If you choose not to install the BSD Subsystem in a custom installation of Mac OS X, this alert appears when trying to use a network printer.
This article has been archived and is no longer updated by Apple.

Symptom

When trying to print to a network printer from any application, an alert box appears with the -9781 error code.

Solution

Use your Mac OS X 10.0 Installation CD to install the BSD Subsystem (BSD.pkg).

This article has been archived and is no longer updated by Apple.

Symptom

The Show Info window does not immediately update the amount of available/used disk space after you add or delete files.

Solution

Apple is aware of this issue.

As a workaround:

- Choose Log Out from the Apple menu.
- Log back in to the computer.

The available/used disk space will be updated.

Archived - Mac OS X 10.0: Restart File Sharing to Make AppleTalk Name Appear on Network

For your AppleTalk name to appear in the Chooser, you must stop and restart Sharing after turning on AppleTalk.

Products Affected

Mac OS X 10.0

This article has been archived and is no longer updated by Apple.

Symptom

Your computer appears in the Network Browser but not in the Chooser.

Solution

After making AppleTalk active, stop and restart Sharing in the System Preferences application.

Mac OS X 10.0: Does Not Label or Sort by Label

- **Last Modified:** September 18, 2003
- **Article:** TA28205

- **Old Article:** 106273

This article has been archived and is no longer updated by Apple.
You can select Label in View Options, but you cannot sort by Label or label items in the Mac OS X Finder.

Products Affected

Mac OS X 10.0

Symptom

1. Mac OS X offers Label in View Options but does not have a feature for applying labels to items.

2. If you select Label in View Options and try to sort by Label, the Mac OS X Finder does not recognize labels applied by Mac OS 9.x or earlier.

Solution

At this time, Mac OS X does not include a feature for applying labels.

If you try to sort by Label, the computer will actually sort by Name.

Mac OS X 10.0: Theater Mode Extension May Prevent Use of Other Applications

Opening a Classic application that uses the Mac OS 9 Theater Mode extension (such as QuickTime Player 4.1.2) may interfere with the use of other Classic applications.
This article has been archived and is no longer updated by Apple.

Symptom

Other Classic applications do not open as expected after using a Classic application that calls on the Mac OS 9 Theater Mode extension. QuickTime Player 4.1.2 uses the Theater Mode extension.

Solution

Mac OS X 10.1 resolves this issue. Users of Mac OS X 10.0 to 10.0.4 can use the QuickTime 5 Player included with Mac OS X.

If the issue occurs with a different Classic application, disable the Theater Mode extension using the Extensions Manager control panel in Classic. You must then restart Classic.

Note: The Theater Mode extension is only present on computers that use it.

Darwin/QuickTime Streaming Server 3: System Requirements

- **Last Modified:** November 16, 2003
- **Article:** TA28214

- **Old Article:** 106314

This article has been archived and is no longer updated by Apple.
This article describes system requirements for QuickTime Streaming Server 3.

Products Affected

Mac OS X Server 10.3, QuickTime

QuickTime Streaming Server 3

QuickTime Streaming Server 3 requires Mac OS X Server 10.0.3 or later.

Apple does not provide technical support for running QuickTime Streaming Server 3 on Mac OS X Server 1.x.

For Mac OS X Server system requirements, please see technical document 106430: "**Mac OS X Server: System Requirements and Recommended AppleShare Client Software**"

Darwin Streaming Server 3

For Darwin Streaming Server 3 system requirements, please see:

Open Source Streaming Server
http://www.publicsource.apple.com/projects/streaming/

TA28214_DarwinQuickTime_Streaming_Server_3_System_Requirements.pdf

Mac OS X: Computer Name Appears Multiple Times in Connect to Server Dialog

Under certain circumstances, a computer using Mac OS X 10.0 through 10.1.5 with file sharing turned on appears more than once in the Connect to Server dialog of another Mac OS X computer.
This article has been archived and is no longer updated by Apple.

Symptom

A computer's name appears more than once in the Connect to Server dialog (Figure 1).

Figure 1 Connect to Server dialog

The symptom occurs when the IP address of the sharing computer is changed. When it advertises itself with its new IP address, it does not remove the advertisement for the old IP address.

Solution

This issue is resolved in Mac OS X 10.2 and later. To work around the issue in earlier versions, you may delete "slp.regfile" on the sharing computer.

At the sharing computer, follow these steps:

1. Open the Terminal application.
2. Type: `sudo rm /var/slp.regfile`
3. Press Return.
4. Type the Admin user password and press Return.
5. Restart the computer.

This symptom will recur if the IP address changes. You may repeat these steps as needed.
Last Modified: Feb 19, 2012

Additional Product Support Information

Mac OS X Server 10.0: Full Distinguished Name Required for Authenticated LDAP Access

This article describes the required formatting needed for the "name" field when using authenticated access to an LDAPv2 server in the Directory Setup application.
This article has been archived and is no longer updated by Apple.
Directory Setup offers an option to "Use the name and password below," or authenticated access, when setting up LDAPv2. This option requires you to enter the full Distinguished Name.

To access this feature:

1. Open Directory Setup.
2. Select LDAPv2.
3. Click Configure.
4. Select a directory in Configure LDAPv2 window and click Edit, or click New.
5. Click the Access tab.

If you click the radio button to select "Use the name and password below," the name required is the full Distinguished Name appropriate for your directory. An example name, if you were using Windows 2000 for authentication, might be:

cn=Administrator, cn=Users, dc=bh212, dc=yourdomain, dc=com

Depending on your setup, these values will vary.

Mac OS X 10.0: Apple System Profiler "Update" Commands Do Not Work

- **Last Modified:** September 18, 2003
- **Article:** TA28247

- **Old Article:** 106402

Most Apple System Profiler menu commands are dimmed after using the "Update all information" or Update System Profile commands.

Products Affected

Mac OS X 10.0

Symptom

After choosing Update all information or Update System Profile from the Commands menu, all items in the File, Edit, and Commands menus are dimmed.

Solution

1. Choose Quit from the Apple System Profiler menu.
2. Reopen the application.

This issue may be avoided by updating to Mac OS X 10.1.

AppleTalk Remote Access: Initiating a Telnet Session

- **Last Modified:** December 04, 1998
- **Article:** TA28248

- **Old Article:** 10642

This article has been archived and is no longer updated by Apple.
Can I use Telnet across AppleTalk Remote Access? Do I need MacTCP on both computers, and will dynamic addressing work?
Yes, Telnet sessions can be initiated from a remote Macintosh using AppleTalk Remote Access and MacTCP. MacTCP only needs to be on the remote Macintosh; the host Macintosh only acts as an AppleTalk bridge. MacTCP behaves as if it were on LocalTalk; dynamic addressing does work.

For more details, read the following article:
Tech Info Library Article 9638" "**AppleTalk Remote: Troubleshooting Inability to Reach TCP/IP Host**"

Mac OS X Server 1.0 to 1.2: System Requirements

- **Last Modified:** April 11, 2005
- **Article:** TA28250

- **Old Article:** 106430

This article has been archived and is no longer updated by Apple.
Use of Mac OS X Server requires computer hardware with the amounts of RAM and hard disk space described in this document. Other considerations, as noted, may apply to your setup.

Note: This document applies only to server versions 1.0 to 1.2v3. Information about versions 10.0.3 to 10.2.8 formerly located in this document has been moved to document **107685**.

Products Affected

Mac OS X Server 10.3, Mac OS X Server

Computers

This table lists computers that are compatible with Mac OS X Server by version.

Computer Model	Mac OS X Server Version		
	1.2v3 See Note 1	1.2	1.0 to 1.0-2
Power Macintosh G3 All-In-One	yes	yes	yes
Power Macintosh G3 Mini Tower	yes	yes	yes
Power Macintosh G3 Desktop	yes	yes	yes
Macintosh Server G3	yes	yes	yes
Power Macintosh G3 (Blue and White)	yes	yes	yes
Macintosh Server G3 (Blue and White)	yes	yes	yes
Power Mac G4 (PCI Graphics)	yes	yes	no
Power Mac G4 (AGP Graphics)	yes	yes	no
Power Mac G4 (Gigabit Ethernet)	yes	no	no
Power Mac G4 (Digital Audio)	no	no	no
Power Mac G4 (QuickSilver)	no	no	no
Power Mac G4 (QuickSilver 2002)	no	no	no
Macintosh Server G4 - See Note 2.	yes	yes	no
Power Mac G4 Cube (all models)	no	no	no
iMac (all models)	no	no	no
eMac (ATI Graphics)	no	no	no
eMac (original model)	yes	yes	no
iBook (all models)	no	no	no
PowerBook (all models)	no	no	no

Important: Only the computers explicitly marked "yes" meet the system requirements for Mac OS X Server. Apple provides technical support **only** for hardware-software combinations that appear on this list. You can use the **Apple Spec Database** to match your computer with its full model name, such as "Power Mac G4 (Gigbit Ethernet)." Mac OS X Server 1.x is not compatible with any computer released in or after January, 2001.

Notes

1. The ATTO UL3D SCSI card is not supported in Mac OS X Server 1.2v3.
2. This refers to Macintosh Server computers concurrent with or earlier than the latest Power Mac G4 hardware generation indicated for a particular version of Mac OS X Server, for example: "(AGP Graphics)" or "(QuickSilver)."

Use on Unsupported Computers

Because software developers sometimes must use older computers with developer releases or need to demonstrate their software using PowerBook computers, Apple has allowed for Mac OS X Server to be installed on certain unsupported computers. Services are only qualified for use on the supported computers listed above by version. If you use Mac OS X Server in an unsupported configuration in a production server environment, performance, reliability, and functionality may all be significantly degraded.

Memory (RAM)

The RAM amounts listed are the minimums required by each version of Mac OS X Server. More RAM may be required for certain services, to support a large number of clients, or for best performance.

Server Software	RAM Required
Mac OS X Server 1.0 to 1.0-2	64 MB
Mac OS X Server 1.2	64 MB
Mac OS X Server 1.2v3	64 MB

Hard disk space

The available disk space amounts listed are the minimums required by each version of Mac OS X Server. More available disk space may be required for certain services, to support a large number of clients, or for best performance.

Server Software	Available Hard Disk Space
Mac OS X Server 1.0 to 1.0-2	1 GB
Mac OS X Server 1.2	1 GB
Mac OS X Server 1.2v3	1 GB

Mac OS X Server 1.0 to 1.2v3: Limitations

Mac OS X Server versions 1.0 to 1.2v3 include the following limitations:

- The DVD drive may be used only with CD-ROM discs (no DVD-RAM).
- If starting up from a SCSI disk, Mac OS X Server can start up only from a disk connected to the first SCSI card.
- FireWire does not work.
- Software RAID does not work.
- Mac OS X Server can detect USB devices on only one of your computer's USB ports at a time. To use a USB mouse, connect it to your keyboard. When using a display that has an ADC (Apple Display Connector), connect your keyboard to USB port 1 on the computer. The USB ports on the display will not work. You cannot plug and unplug the keyboard or mouse while the computer is turned on.
- Mac OS X Server works only with built-in video and Apple-supplied video cards.

Archived - Mac OS 9.2.1: Installs QuickTime 5, Which May Require a New QuickTime Pro Key

Mac OS 9.2.1 installs QuickTime 5. Earlier QuickTime Pro keys do not work with QuickTime 5.

Products Affected

Mac OS 9.2, QuickTime

This article has been archived and is no longer updated by Apple.
Symptom

Your QuickTime Pro key does not enable Pro features.

Solution

Your QuickTime Pro key was purchased too long ago to work with QuickTime 5.

To enable QuickTime Pro features:

- Purchase a new QuickTime Pro key from The Apple Store (http://www.apple.com/store/), or
- Reinstall QuickTime 4 and use your existing Pro key.

The Mac OS 9.2.1 installation includes QuickTime 5. Some earlier QuickTime Pro keys do not work with QuickTime 5 requiring that you either purchase a new QuickTime Pro key or reinstall QuickTime 4 for Pro features.

You should use QuickTime 5 with Mac OS 9.2.1 as Apple has tested the two together. However, you may reinstall QuickTime 4.1.2.

QuickTime Download area
http://www.apple.com/quicktime/download/support/

Mac OS X 10.1, AppleWorks 6: Windows Appear Small or Off Screen

- **Last Modified:** September 17, 2003
- **Article:** TA28264

- **Old Article:** 106515

After updating to Mac OS 10.1, windows and palettes in AppleWorks 6 may appear either small or off screen.

Products Affected

AppleWorks, Mac OS X 10.0

Symptom

Windows and palettes in AppleWorks 6 are drawn either small or off screen.

Solution

Download and install AppleWorks 6.2.2 or later from Apple Software Downloads (http://www.apple.com/swupdates/).

Mac OS 9: USB Audio Skips When Copying Files to or From a Zip Disk

- **Last Modified:** November 15, 2003
- **Article:** TA28269

- **Old Article:** 106533

This article has been archived and is no longer updated by Apple.
USB audio may skip and stutter when copying files to or from a Zip disk.

Products Affected

Mac OS 9.0, Mac OS 9.1, Mac OS 9.2

Symptom

When copying files to or from a Zip drive on a computer with USB speakers, audio playback skips and stutters. The behavior is most apparent when the Finder Copy window is the active window.

Solution

- Use a USB Zip drive.

or

- Upgrading to Mac OS X resolves this issue.

The software driver for the Zip disk causes audio playback through USB speakers to skip. Iomega is aware of this issue and is investigating possible solutions for Mac OS 9 users of Zip devices.

You can minimize the behavior during file copies to and from the Zip drive by clicking in another window to make it active, instead of the Finder Copy window.

System 7.1: PowerBook and Macintosh Portable Installer Scripts

Will system software version 7.1 include custom installer scripts for the entire Macintosh PowerBook series? Or, will we have a similar situation to the PowerBook 145 introduction that is discussed in article "PowerBook 145: Peculiarities With System Software Version 7.0.1"?

This article has been archived and is no longer updated by Apple.
System software version 7.1 will include custom installer scripts for these PowerBook and Portable products:

* Macintosh Portable
* Macintosh PowerBook 100
* Macintosh PowerBook 140/145
* Macintosh PowerBook 170

The new PowerBook products being introduced in fall 1992 each include an "Install Me First" disk (referred to as a "System Enabler") with system software version 7.1 installation disks.

This System Enabler disk includes minor changes to the system software shipped with the new product that are specific to that product.

See these related TIL articles for more details:

PowerBook 145: Peculiarities With System Software Version 7.0.1
System Software: "Install Me First" Disk and System Enablers

Mac OS X 10.1: Euro Appears in Different Locations on French and French-Numerical Keyboard Layouts

- **Last Modified:** September 18, 2003
- **Article:** TA28280

- **Old Article:** 106565

This article has been archived and is no longer updated by Apple.
The euro sign appears in different locations in the French and French-numerical keyboard layouts.

Products Affected

Mac OS 9.2, Mac OS X 10.1, Mac OS X 10.0

Symptom

The keyboard shortcut for the euro sign differs on the French and French-numerical keyboard layouts. On the French keyboard layout it is Option-$. On the French-numerical keyboard layout it is Shift-Option-R. The euro sign is printed on the keycap of the key with the dollar sign ($) on the French keyboard.

Solution

Apple is aware of this issue. This is the expected behavior for these versions of Mac OS X.

Mac OS X 10.1.1: Desktop Area Underneath and Bordering the Dock is Reserved

- **Last Modified:** November 15, 2003
- **Article:** TA28283

- **Old Article:** 106587

Mac OS X 10.1.1 prevents desktop icons from being placed underneath or against the Dock. The reserved area depends on the size and location of the Dock.

Products Affected

Mac OS X 10.0

Symptom

Items cannot be placed under or against the Dock. Doing so results in the item(s) being relocated to a location other than that expected.

Solution

This is a feature of Mac OS X 10.1.1.

The reserved area corresponds to the size and location of the Dock. You can move or resize the Dock to change the reserved area. You can adjust the Dock in System Preferences.

For the most consistent experience, do not place items near the Dock.

AirPort 2.0: How to Connect to a LEAP-Enabled Wireless Network

- **Last Modified:** November 14, 2003
- **Article:** TA28291

- **Old Article:** 106626

This article has been archived and is no longer updated by Apple.
With AirPort 2.0 software, you can connect to a LEAP-enabled wireless network as described in this document.

Products Affected

AirPort

AirPort 2.0 software works with LEAP (Lightweight Extensible Authentication Protocol), a client-side authentication protocol developed by Cisco.

AirPort-equipped clients using the AirPort 2.0 software may access 802.11 wireless networks that require LEAP for login.

To connect to a LEAP network:

You select a LEAP-enabled network as you would any other. The difference is in how you enter the password. When prompted for the password, enter the LEAP user name and LEAP password separated by a solidus (/), or "slash." Enclose this in angle brackets. For example, if your user name is "clarice" with a password of "secret," you would enter:

<clarice/secret>

Notes

1. The opening and closing angle brackets are required.
2. AirPort 2.0 works with both the Draft 8 and Draft 10 versions of Cisco LEAP.
3. AirPort software does not save your LEAP user name and password for future login.
4. You must reconnect to the network after restarting your computer or waking it from sleep.
5. To prevent confusion, do not use the LEAP password format on a non-LEAP network.
6. LEAP is a client-side authentication method designed to be used with third-party base stations only.

TA28291_AirPort_2-0_How_to_Connect_to_a_LEAP-Enabled_Wireless_Network.pdf

ARA: Turn On AppleTalk in Chooser After Installing ARA

- **Last Modified:** December 20, 1999
- **Article:** TA28305

- **Old Article:** 10670

Upon initial installation of AppleTalk Remote Access (ARA), AppleTalk is turned off in the Chooser. When new users select ARA, they get a message saying that ARA wasn't correctly installed or is corrupted and they should re-install. Repeated installation efforts give the same results. The dialog is persistent whether it's a brand new installation or an existing (and previously working ARA) setup.

The real problem is that AppleTalk is turned off, and you must turn on AppleTalk in the Chooser for ARA to work at all.

Does Apple plan to change the dialog box to instruct users to turn AppleTalk on?
This problem will be fixed in the next release of AppleTalk Remote Access. The error dialog will say something about going into the Chooser and turning on AppleTalk.

Note: You can also use the Always AppleTalk software which is part of the PowerBook File Assistant collection of software. This allows a System 7.1 user to switch between AppleTalk being active and inactive without restarting the computer.

Cause of Incorrect Messages in Several Utilities

The problem is that the 7.0 Tune Up doesn't load enough of AppleTalk to let anyone know that AppleTalk is turned off. As a result, ARA and several other network utilities are unable to function, and display a false error message.

There is a way to tell whether AppleTalk can be turned on. The revised meaning of the Gestalt 'atkv' selector is that if the selector is present, it returns the "available" version of AppleTalk. If the selector isn't present, then AppleTalk isn't available.

Note: Tthis differs from the 'atlk' selector, which returns zero if AppleTalk is currently off, and the AppleTalk version if AppleTalk is currently on. But this only tells you the current state; it doesn't tell you if AppleTalk COULD be turned on in the Chooser without restarting.

AppleTalk Remote Access calls gestalt with the 'atkv' selector to make sure that the correct AppleTalk is installed. But, there is no 'atkv' selector because Tune Up prevented the AppleTalk boot code (which installs the selector) from running. ARA then complains that your software is incorrectly installed if the selector is not present. At the time ARA was released, this was the correct behavior. Since Tune Up has come along, the rules have changed. Now the lack of an 'atkv' selector means that AppleTalk can't be turned on without restarting.

Another aspect of the problem is that when the LAP manager loads, it checks PRAM to see if AppleTalk has been configured. If these bits in PRAM have never been configured or if PRAM has been "zapped," the LAP manager would believe that AppleTalk was turned off. If PRAM is zapped, then the AppleTalk status setting may be left in an indeterminate state. There was a change, beginning with AppleTalk 57 on how the setting in PRAM is interpreted:

AppleTalk Version <57 >=57

PRAM setting ON ON ON
PRAM setting indeterminate ON OFF
PRAM setting OFF OFF OFF

Therefore if you ever zapped PRAM, the AppleTalk status setting may have been left in an indeterminate state. AppleTalk Remote Access updates AppleTalk to version 57.0.1, and displays the "improperly installed" message because it determines that AppleTalk is turned off.

(PowerBook users don't know any of this. Their computers come with Tune Up pre-installed and AppleTalk off.)

Other utilities and applications will also suffer from the problem. The Network control panel, MacTCP, and DAL with Tune Up installed and AppleTalk off all suffer from the same problem and the user is presented with a similar "not installed correctly" message.

* MacTCP gives the error -43 (driver not installed).

* DAL will just not connect to any of its servers or the DAL installation checker will show no network adaptor (drivers) cards.

* The Apple Internet Router give the error message "The router software was damaged or incorrectly installed. Please re-install the router."

The Solution

AppleTalk version 57.0.4 fixes these problems for most cases.

* If PRAM is unconfigured, it no longer believes that AppleTalk is off, instead it believes it is on.

* The Network control panel now displays a more appropriate message telling users that AppleTalk is turned off instead of telling them that their software has been incorrectly installed.

* Future revisions of AppleTalk Remote Access and Apple Internet Router will have more meaningful error messages.

* In System 7.1 MacTCP, LAT, and DAL will load whether AppleTalk has been turned on or off.

Archived - QuickTime Streaming Server: How to Bind QTSS to a Single IP Address on a Computer That Is Multihoming

You may edit the streamingserver.xml file to bind QuickTime Streaming Server to a single IP address on a Mac OS X computer that is multihoming.
This article has been archived and is no longer updated by Apple.
Follow these steps to bind QuickTime Streaming Server to a single IP address:

1. Stop the QuickTime Streaming Server process.
2. Locate the file "streamingserver.xml".
In QTSS 3: /etc/streaming/streamingserver.xml
In QTSS 4: /Library/QuickTimeStreaming/Config/streamingserver.xml
3. Open the file in TextEdit or another text editing application.
4. Find the following line: <PREF NAME="bind_ip_addr" >0</PREF>
5. Replace the 0 in this line with the IP address to which you would like to bind QuickTime Streaming Server. For example:
<PREF NAME="bind_ip_addr" >192.168.1.1</PREF>
6. Save the file.
7. Restart the computer.
8. Start the QuickTime Streaming Server process.

Last Modified: Feb 19, 2012

Archived - Mac OS X Server 10.0, 10.1: "5015 error" Alert Message When Saving Newly Created Users

This article has been archived and is no longer updated by Apple.

While editing or creating users in the Users and Groups module of Server Admin, an alert box with a "5015 error" message appears. This document explains how to resolve this issue.

Symptom

In the Server Admin application, an alert box with a "5015 error", "error of type 5015", or similar message appears.

Solution

This may occur if the "tim" value is out of synchronization with the "tim" database. Mac OS X Server uses the "tim" value during the authentication process when Windows file sharing users connect.

Warning: Resolution of this issue includes editing the NetInfo database. Be sure to follow the directions precisely. Incorrectly editing the NetInfo database may render the server software unusable, requiring that you reinstall or restore from backup.

Follow these steps to resolve this issue:

1. Open NetInfo Manager at the server (/Applications/Utilities).
2. Click the padlock to make changes, then authenticate using your Admin user name and password.
3. From the second Directory Browser column, select Users.
4. From the third Directory Browser column, select root.
5. Note that the root user's properties then become visible in the pane below.
6. Locate the property "tim_password", then double-click its value. This inserts the cursor into the value's text field.
7. Highlight the value text, then press the Delete key.
8. Press the Tab key.
9. Choose Save from the Domain menu.
10. When prompted to Confirm Modification, click "Update this copy".
11. Quit NetInfo Manager.
12. Open Server Admin.
13. Choose Show Users & Groups list from the Users & Groups module.
14. Select the checkbox for Show System Users & Groups.
15. Select the user named System Administrator.
16. Click Edit.
17. Enter a password for this user (see Note, below).
18. Click Save.

Note: These steps change the root password of the server. If the password you enter in Step 17 is different from the original password entered in Setup Assistant, the result is that the original Admin user and the root user have different passwords, which by default are the same on Mac OS X server. For more on the default behavior of the root and Admin passwords, and how it differs from Mac OS X client, see technical document 106361, "**Mac OS X 10.0, 10.1: Password Does Not Work As Expected After a Change**".

When hosting a NetInfo domain

If you are hosting a network domain, You may need to repeat these steps for the network domain. To access the network domain in NetInfo Manager, you would click Open Parent Domain at the beginning of Step 3. This button's icon is a blue globe with an arrow. In step 13, you would choose the desired domain from the Show Users and Groups List submenu.

Additional Product Support Information

Mac OS 9: Computer Stops Responding While Printing

- **Last Modified:** September 09, 2003
- **Article:** TA28343

- **Old Article:** 106914

This document discusses how to troubleshoot a printing issue that causes the computer to stop responding (a "hang" or "freeze") while printing.

Products Affected

Mac OS 9.2, Mac OS 9.1, Mac OS 9.0

Symptom

When you choose the Print command, or while printing, the computer stops responding.

Solution

The troubleshooting steps for a printing issue that occurs while printing are the same as those for a printer that will not print. You must be sure that the printer is connected correctly, does not have power issues, and has software that is compatible and properly installed. You may also need to perform other Mac OS troubleshooting, including hardware isolation. See technical document 106912, "**Mac OS 9: How to Troubleshoot a Printer**".

Mac OS X 10.1.5: Time to Shut Down Increases When SCSI Drives Are Connected

- **Last Modified:** October 04, 2008
- **Article:** TA28353

- **Old Article:** 106954

This article has been archived and is no longer updated by Apple.
With Mac OS X 10.1.5, the time required to shut down the computer increases when SCSI drives are connected.

Products Affected

Mac OS X 10.0, Mac OS X 10.1

Each attached SCSI drive may increase the time required to shut down. The computer should shut down properly in a short time.

Note: This issue does not occur when logging out or restarting.

Mac OS X 10.2: Address Book - Cannot Delete Person in Card Only View

You must switch to the Card and Column view to use the Delete Person command.

Products Affected

Mac OS X 10.2

This article has been archived and is no longer updated by Apple.

Symptom

The Delete Person command is dimmed if a card is opened in the Card Only view.

Solution

Follow these steps to delete the card:

1. Choose View > Card and Columns.
2. Select a different card in the Name column.
3. Reselect the card you wish to delete.
4. Choose View > Delete Person.

Mac OS X 10.2: Expected, User-Defined Windows (SMB) Computer Name Does Not Appear in Connect to Server Dialog

- **Last Modified:** September 09, 2003
- **Article:** TA28373

- **Old Article:** 107085

Because SMB (Windows File Sharing) prefers DNS service to the user-defined computer (host) name in Mac OS X 10.2 or later, you may not see the expected computer name.

Products Affected

Mac OS X 10.2, Mac OS X 10.0

Symptom

In the Connect to Server dialog, computers are listed with names that look like:

- dhcp192.168.10.12
- h2n1079p2

The name that you entered for the computer, such as "Melindas-Computer", does not appear.

Solution

If DNS reverse lookup is available on your network, computer names are derived from it when using the Connect To Server command to browse the network neighborhood (SMB workgroup). Your computer's DNS name is listed as the Network Address in the Sharing preference pane.

The format these names take depends on how your DNS administrator has set up the DNS naming structure. They may be generic port names or IP addresses, as in the examples above. Alternatively, they may be actual names similar to what you might choose for yourself, such as "melindas-computer.example.com". You may ask your DNS administrator to assign more desirable host names, rather than generic names.

TA28373_Mac_OS_X_10-2_Expected_User-Defined_Windows_(SMB)_Computer_Name_Doe

If DNS reverse lookup is not available for the sharing computers, Mac OS X will find the user-defined SMB workgroup name for the computer.

You cannot set Mac OS X 10.2 to prefer user-defined names to DNS names.

TA28374_Mac_OS_X_10-2_(Japanese)_Cannot_Type_Japanese_Text_in_Address_Book.pdf

Archived - Mac OS X 10.2 (Japanese): Cannot Type Japanese Text in Address Book

The text typed in the Address Book may disappear when using the Kotoeri, ATOK, or EGBRIDGE input methods.
This article has been archived and is no longer updated by Apple.

Symptom

1. Kotoeri and EGBRIDGE: When you type a character in a text field and press delete to erase the character (or press Esc (Escape) to cancel text entry), the text field disappears.

2. ATOK: When you type Japanese text in the text field in Address Book and press Return to confirm, the text field, and all text you typed in the field disappears.

Solution

Update to Mac OS X 10.2.4 or later.

Mac OS X Server 10.2 (Japanese): Cannot Log in via Open Directory Assistant on Remote Computer

- **Last Modified:** September 17, 2003
- **Article:** TA28380

- **Old Article:** 107126

This article has been archived and is no longer updated by Apple.
To log in (authenticate) to the server via Open Directory Assistant on a remote computer that has Japanese as its preferred language, Japanese must also be the preferred language for the server during its initial configuration.

Products Affected

Mac OS X Server 10.3, Mac OS X 10.2

Symptom

If you open the Open Directory Assistant (ODA) application program on a remote client that has Japanese set as its preferred language, ODA cannot connect to the server.

Solution

When the preferred language of a remote computer that is used for administration is set to Japanese, the server must also have had Japanese selected during its initial configuration. Computers sold with Mac OS X Server preinstalled have English selected as the preferred language.

You may prevent or resolve this by changing the preferred language on the server to Japanese. If the server has a monitor and keyboard connected, you may use System Preferences at the server to change the language, then rerun the Server Assistant. You can do this from the affected remote computer by using the "languagesetup" command-line tool.

To perform these steps from a remote computer, follow these steps:

1. Start up the server.
2. Open Server Assistant.
3. Click Configure, then Continue.
4. Confirm the IP address of the server.
5. Open the Terminal (/Applications/Utilities/).
6. At the prompt, type: `ssh -l root <ip_address>`

Note: Where the example says "<ip address>", you would type the actual IP address of the server. An actual entry might look like:

```
ssh -l root 10.0.1.2
```

7. Press Return.
8. If prompted to create an RSA key, type "yes" and press Return.
9. Type: `languagesetup`
10. Press Return. You will be prompted to select a language.
11. Type: `2`
12. Press Return.
13. Type: `exit`
14. Press Return.
15. Quit Terminal.
16. Go back to Server Assistant, and continue configuring the server.

Mac OS X Server: Memory Leak in Workgroup Manager

- **Last Modified:** November 05, 2003
- **Article:** TA28382

- **Old Article:** 107132

Workgroup Manager can use a growing amount of memory if left open for an extended period of time. This is sometimes called a "memory leak".

Products Affected

Mac OS X Server 10.3

Symptom

Workgroup Manager uses a growing amount of memory.

Solution

Do not leave Workgroup Manager open for an extended period of time (more than 48 hours). If you have left Workgroup Manager open for an extended period of time, quit and reopen Workgroup Manager.

Note: The effect of the memory leak can be lessened by setting the Auto-refresh value in Workgroup Manager Preferences to a higher value. The default is 300 seconds.

Mac OS X Server 10.1: Web Server Access Log Shows IP Address of Server, Not of Clients

- **Last Modified:** September 17, 2003
- **Article:** TA28394

- **Old Article:** 107198

This document explains why the Web Server access logs may show the server's IP address instead of the clients', and explains how to resolve this.

Products Affected

Mac OS X Server 10.3

Symptom

When reading the access logs, you see the server's IP address instead of the clients'.

Solution

This issue is caused by the Performance Cache. When active, Performance Cache uses port 80 and passes requests to Apache on port 16080, which means that logging remote hosts logs the server's IP address. To turn the cache off, follow these steps:

1. Go to the Web Services configuration in the Server Admin.
2. Click the Sites tab.
3. Select your site, and then click Edit.
4. In the window that appears, deselect the checkbox for Enable Performance Cache.

For more information, see technical documents:

106407: "**Mac OS X Server 10: Web Service Uses Ports 80 and 16080 by Default**"
107017: "**Mac OS X Server 10.2: About the Web Service access_log Format**"

Mac OS X Server 10.2: Server Does Not Appear in List When Configuring Group Volumes

- **Last Modified:** October 14, 2003
- **Article:** TA28405

- **Old Article:** 107306

When configuring a Group Volume within Workgroup Manager, the server does not appear in the list to be selected.

Products Affected

Mac OS X Server 10.3

Symptom

When configuring the Group Volume feature in Workgroup Manager, the server does not appear in the list to be selected.

Solution

In Mac OS X Server 10.2.3 or later, configuration of Group Volumes/Directories has been improved to more clearly convey how to use this option. See technical document 107265, "**Mac OS X Server: About the Mac OS X Server 10.2.3 Update**".

For versions 10.2 to 10.2.2:

To make your server appear in this list, the /Groups share point must be configured for automatic connection. However, it is not necessary to select your server from the list. Instead, you may enter the DNS name or the IP Address for the appropriate server.

Note: Automatic connection (automounting) is not required to use Group Volumes and may not be the preferred option. If this is the case, manually enter the DNS name or the IP Address of the server in the "Server" field. The fully qualified domain name is not required, you may enter just the hostname.

Mac OS X Managed Client: How to Differentiate Between a Group and a Workgroup

- **Last Modified:** September 15, 2003
- **Article:** TA28406

- **Old Article:** 107309

This document explains how to tell a "group" from a "workgroup."

Products Affected

Mac OS X Server 10.3

Page 128 of the 10.2 Server Admin Guide states:

> "When you define preferences for a group it is known as a workgroup. A workgroup provides you with a way to manage the working environment of group members."

This is important, since some features only work with workgroups. An example when logging in as a Mac OS X client is that users are only able to select workgroups for preference management; groups are not available for selection. This example is explained in technical document 107308, "**Mac OS X Server 10.2: Managed Clients Cannot Select a Workgroup While Logging In**".

Though a user logging in from a managed Mac OS X client can select only one workgroup at a time, that user can belong to multiple groups on the server for purposes of file system privileges or email use.

To determine whether a group is a workgroup or not, check each of the different managed preference options in Workgroup Manager. If any of the preference options are managed, it's a workgroup. If nothing is managed, it's a group.

Mac OS X Server 10.2: Configuring as Authentication "Child" Does Not Stop Password Server

- **Last Modified:** October 14, 2003
- **Article:** TA28407

- **Old Article:** 107315

The configuration of Mac OS X Server as a "child" server that gets authentication information from a different "parent" server does not in itself stop the password service on the child server. The configuration in question occurs when you select password information option "obtained from another system" in Open Directory Assistant. This document explains how you should configure the server to get authentication information from another server.

Products Affected

Mac OS X Server 10.3

Symptom

Password service continues on your server after you configure it to authenticate to another (parent) server.

Solution

If you would like to change your configuration from being a password server to obtaining password information from another password server, follow these steps:

1. Open the Open Directory Assistant.
2. In the Security panel, select the option for password information to be "stored and accessed locally in user records."
3. Save this setting and restart the server.
4. Open the Open Directory Assistant.
5. Select the option for password information to be "obtained from another system."
6. Save this setting and restart the server.

After following these steps, the Password Server process should not be running on the original server.

Mac OS X Server 10.2: Setup Assistant Does Not Recognize Certain Volume Names When Connecting Remotely

- **Last Modified:** September 09, 2003
- **Article:** TA28408

- **Old Article:** 107316

When connecting to a server remotely, Setup Assistant does not recognize volume names that contain an apostrophe, or that have a space at the end of the name.

Products Affected

Mac OS X Server 10.3

Symptom

Setup Assistant does not recognize your volume name.

Solution

Rename the affected volumes so that they do not contain an apostrophe or a trailing space.

Mac OS X Server 10.2: Server Status Does Not Display All Status Items After Language Change

- **Last Modified:** September 09, 2003
- **Article:** TA28410

- **Old Article:** 107342

Server Status items may not be displayed completely after installing Mac OS X Server 10.2 in one language and subsequently changing the language setting in the International preference pane.

Products Affected

Mac OS X Server 10.3

Symptom

After connecting to a Mac OS X 10.2 server using the Server Status application, it is possible to experience incomplete or Status: "Not available".

Solution

This happens because the language for the list of servers in Server Status is only designated when the server is added. To resolve the issue:

1. Remove the server at issue from the list in Server Status.
2. Change the language in the International preference pane.
3. Add the server back into the Server Status list after changing the desired language.

Advanced alternative

1. Quit Server Status.
2. At the computer on which Server Status is being used, delete the file:

~/Library/Preferences/com.apple.ServerStatus.plist

Mac OS X Server 10.2.3 or Later: Admin Tools Installation Requires Mac OS X 10.2.3 or Later Client

- **Last Modified:** September 09, 2003
- **Article:** TA28411

- **Old Article:** 107349

The Admin Tools installation CD for Mac OS X Server 10.2.3 or later will not install on Mac OS X Server. It checks the destination disk for the presence of the non-server (client) version of the Mac OS X 10.2.3 or later operating system. Installation on Mac OS X Server 10.2.3 or later requires the use of of the appropriate version of the Mac OS X Server Installation CD.

Products Affected

Mac OS X Server 10.3

Symptom

You cannot use the Admin Tools CD to install on the server. You see a message that "Mac OS X Client" or Mac OS X Server 10.2.3 is required for installation.

Solution

This installation will not occur if you try to reinstall the Admin Tools on a Mac OS X Server 10.2.3 or later volume. If you need to reinstall the Admin Tools on a Mac OS X Server 10.2.3 or later volume, use the Mac OS X Server 10.2.3 or later installation CD.

Mac OS X 10.2.3 and Later: Some Window Buttons Lack Drop Shadow, Appear Countersunk

- **Last Modified:** September 09, 2003
- **Article:** TA28413

- **Old Article:** 107350

Applications with brushed-metal appearance themes may incorporate slight changes to the close (red), minimize (yellow), and maximize (green) buttons that you may use to manipulate windows. The buttons appear countersunk (rather than raised) and thus do not have drop shadows.

Products Affected

Mac OS X 10.2, Mac OS X 10.0, iChat, iSync, iCal

Symptom

The close, minimize, and maximize buttons in certain applications' windows have a new appearance. They appear countersunk (rather than raised) and thus lack drop shadows.

Solution

This is deliberate design change. Not all brushed-metal-themed applications will automatically inherit this change (such as iTunes). No troubleshooting is necessary.

Mac OS X Server: How to Forward "Unknown" Mail to a Different User or Users

- **Last Modified:** September 17, 2003
- **Article:** TA28416

- **Old Article:** 107373

When the server receives mail addressed to unknown local users, it may be forwarded to a specified user or users. This document explains how to set that up.

Products Affected

Mac OS X Server 10.3

Mail service can be configured to forward mail addressed to unknown local users. To do so, follow these steps:

1. In Server Settings, click the Internet tab.
2. Choose Mail Service > Configure Mail Service.
3. Click the Messages tab.
4. Select the "Forward mail addressed to unknown local users" checkbox.
5. Add the short name of the user or group you wish to receive the mail (see Note).

Note: If you want multiple users to receive the forwarded mail, you must enter the name of a group to which they belong. If you do not already have a suitable group, use Workgroup Manager to create a group that contains these users.

Mac OS X 10.2: OBEXAgent Unexpectedly Quits During Login

- **Last Modified:** September 09, 2003
- **Article:** TA28417

- **Old Article:** 107377

OBEXAgent may unexpectedly quit when logging into Mac OS X 10.2. This document explains how to resolve the issue.

Products Affected

Mac OS X 10.2, Mac OS X 10.0

Symptom

When starting up, restarting, or logging into Mac OS X 10.2, the file "OBEXAgent.crash.log" is created at ~/Logs/CrashReporter. It is displayed on the screen if Console is set to automatically display crash logs.

Solution

Drag this file to the Trash:

/Applications/Extras/Bluetooth/OBEXAgent

It is no longer needed in Mac OS X 10.2.

Alternately, you can also remove OBEXAgent from the Login Items pane of System Preferences.

Mac OS X Server: Cannot NetBoot From 10.2 Image When Client Has Only Internal SCSI Hard Drive(s)

- **Last Modified:** September 10, 2003
- **Article:** TA28420

- **Old Article:** 107384

If you try to NetBoot a computer that has only an internal SCSI hard drive (no ATA/IDE) from a Mac OS X 10.2 NetBoot image, the computer may shut down during the attempt.

Products Affected

Mac OS X Server 10.3, Mac OS X 10.2, Mac OS X 10.0

Symptom

A client computer that only has an internal SCSI hard disk drive installed cannot NetBoot. The computer may shutdown during the startup process.

Solution

Mac OS X Server 10.2 does not support NetBoot for clients that have only an internal SCSI hard disk drive. There are two alternative solutions you may consider:

1. Add an internal ATA hard disk drive to the computer, so that it may NetBoot, or,

2. Use Workgroup Manager instead. This provides Mac OS X client management features similar to those used in NetBoot, but while starting up from the internal drive.

Mac OS X 10.2: Find by Content Returns 100 Results Maximum

- **Last Modified:** November 14, 2003
- **Article:** TA28425

- **Old Article:** 107413

This article has been archived and is no longer updated by Apple.
When using the "content includes" feature of the Find command, a maximum of the first 100 matches are displayed. (This refers to the Find command located in the File menu of the Finder.)

Products Affected

Mac OS X 10.2, Mac OS X 10.0

Symptom

A "content includes" search never returns more than 100 matches.

Solution

The results of a content search are limited to a maximum of 100 items. Other types of searches do not have this limit. To work around the issue try these techniques:

- Search again with more specific search terms. For example, instead of searching for "Apple" search for "Apple Computer".
- Search again in a more specific volume or folder. For example, choose"Specific places" instead of "Everywhere" and add your Documents folder into the "Specific Places" list.

Apple Font Pack

- **Last Modified:** October 04, 2008
- **Article:** TA28426

- **Old Article:** 10742

This article has been archived and is no longer updated by Apple.
The Apple Font Pack, a retail software product, includes a selection of TrueType fonts from leading type vendors. The Apple Font Pack addresses the typographic needs of mainstream customers. It requires minimal system overhead, and makes fonts easy to use with one-click installation and a booklet to educate customers on how to effectively use type to create compelling documents. It is available through authorized resellers.

Contents

The Apple Font Pack contains:

* 25 new Apple fonts, all from leading type foundries. These are listed below.

* 18 of the fonts Apple has been shipping with the LaserWriter and StyleWriter printers.

* The Apple LaserWriter Driver and LaserWriter Font Utility software for using the fonts with Apple and third-party PostScript laser printers.

The Apple Font Pack, added to the 21 fonts that come with System 7, brings Apple's font offering for the Macintosh computer to 64.

Enhanced LaserWriter Printers

The 25 new fonts will also be added to the library of fonts included with Apple's network printers: the LaserWriter IIf, LaserWriter IIg, and Personal LaserWriter NTR. This boosts the font offering to 64 for customers using any Macintosh computer with these printers.

Compatibility and Configurations

The Apple Font Pack requires a Macintosh personal computer running System 7. The LaserWriter IIf, LaserWriter IIg, and Personal LaserWriter NTR printer font sets are compatible with Macintosh computers running System 6.0.7 or System 7. Once installed, the fonts are compatible with any Macintosh printer or output device, and with third-party printers.

Mac OS X: Unexpected Mouse or Keyboard Behavior While Classic is Starting

- **Last Modified:** September 17, 2003
- **Article:** TA28431

- **Old Article:** 107448

The Advanced section of the Classic preference pane allows you to select a key combination for use while Classic is starting. If a key combination is selected there, Classic will register the keys as being down until Classic is finished starting. This may cause unexpected behavior if another program needs keyboard input before Classic is finished starting.

Products Affected

Mac OS X 10.1, Mac OS X 10.0

Symptom

While Classic is starting, it stops at a MacsBug screen or seems to be ignoring keyboard input.

Solution

When Classic is starting, you may bypass the selected key combination by pressing and releasing each selected key. After the keys are manually pressed, Classic treats them as if they are no longer pressed.

Mac OS X Server 10.2: NetBoot Does Not Work for Mac OS 9 Clients

- **Last Modified:** September 10, 2003
- **Article:** TA28441

- **Old Article:** 107504

Mac OS 9 NetBoot no longer works after installing the NetBoot software included with Mac OS X Server 10.2.

Products Affected

Mac OS X Server 10.3

Symptom

The NetBoot software installation is successful, but Mac OS 9 client computers cannot start up via NetBoot.

Solution

Restart the server. The Installer does not force the server to restart, but NetBoot will not work until the AppleFileServer process is restarted.

If the part number of the NetBoot installation CD is 0Z691-3990-A (printed on the CD), there is an additional issue in that the images are not installed with the proper type and creator. This CD is included with Xserve computers that included Mac OS X Server 10.2. Follow these additional steps to correct this issue:

1. Log in with the root account. If you need help with this step, see technical document 106290, "**Mac OS X: About the root User and How to Enable It**".
2. Open the Script Editor application (/Applications/AppleScript/).
3. Enter the following into the script window:

```
on open filelist

    repeat with x in filelist
```

```
        tell application "Finder"
            set file type of x to "dimg"
            set creator type of x to "ddsk"
        end tell
    end repeat
end open
```

4. Save the script as an application.
5. Navigate to:

/Library/NetBoot/NetBootSP0/MacOS92Default.nbi

6. Drag "NetBoot HD.img" and "Applications HD.img" onto the application created in step 4.
7. Delete all the client shadow files, if any. They are located at:

/Library/NetBoot/NetBootClients<X>

This is true for all Mac OS Extended format (HFS Plus) volumes, where "<X>" is a number.

Archived - Mac OS X Server 10.2: Specify Protocol When Configuring a Group Folder

When configuring a Group Folder using the Advanced option, you must specify the protocol to be used.

Products Affected

Mac OS X Server 10.3

This article has been archived and is no longer updated by Apple.
When configuring a Group Folder using the Advanced option, you must specify the protocol to be used in the URL field. Apple Filing Protocol (AFP) is the preferred protocol to use.

For example, the following URL is incomplete:

server.example.com/Groups

This example is complete:

afp://server.example.com/Groups

Note: The full path the share point is required when configuring a Group Folder using the Advanced option. For more information, see technical document 107510, "**Mac OS X Server 10.2: Group Folders Require Full Path**".

Mac OS X Server 10.2: "dsimportexport" Imports But Does Not Export

- **Last Modified:** October 14, 2003
- **Article:** TA28452

- **Old Article:** 107528

The "dsimportexport" command does not have the ability to export data from a Directory Service database. It will import information as documented.

Products Affected

Mac OS X Server 10.3

Symptom

The Mac OS X Server Administrator Guide and help files state that the dsimportexport command will import and export data. In reality, it will only import.

Solution

Use Workgroup Manager to export information stored in Directory Service databases.

Mac OS X 10.2.5: Files Unusable After Copy via AFP

- **Last Modified:** October 14, 2003
- **Article:** TA28455

- **Old Article:** 107541

Files written, cached, or explicitly saved by a Mac OS X 10.2.5 client to an Apple Filing Protocol (AFP) server may become unusable under certain circumstances. Update to Mac OS X 10.2.6 or later to prevent this issue.

Products Affected

Mac OS X 10.2

Symptom

Files written via AFP no longer work as expected.

Note: Examples of AFP connections are Apple File Service, Personal File Sharing, and AppleShare. Copies performed in the Mac OS X Finder are not likely to be affected.

Solution

Update to Mac OS X 10.2.6 or later.

Mac OS X Server 10.2 or Later: How to Limit QuickTime Streaming to Selected IP Addresses

- **Last Modified:** September 10, 2003
- **Article:** TA28460
- **Old Article:** 107563

If your server has multiple IP addresses, you can limit QuickTime Streaming Server to a specific IP address or addresses.

Products Affected

Mac OS X Server 10.3, QuickTime

In the default configuration, QuickTime Streaming Server is available on all configured interfaces and IP addresses. A multi-port server would have QuickTime Streaming Server available to clients connecting to any interface. The server can be configured to serve from one or more specified IP addresses by using the "bind_ip_addr" property in the QuickTime Streaming Server configuration file. Follow these steps:

1. Open this file in a text editor: /Library/QuickTimeStreaming/Config/streamingserver.xml

Note: If you need help with this step, see technical document 106619, "**Mac OS X Server: How to Locate and Edit Configuration Files**".

2. Find the line:

```
<PREF NAME="bind_ip_addr" >0</PREF>
```

3. Edit the line to look like this:

```
<LIST-PREF NAME="bind_ip_addr" >
  <VALUE>10.1.1.1</VALUE>
  <VALUE>10.1.1.2</VALUE>
</LIST-PREF>
```

Note: You would replace the two IP addresses in the entry above with the two actual addresses that you wish to bind to. Use of two addresses is only an example. You could bind to more or fewer by adding or deleting an address line in the entry above. Do not include localhost (127.0.0.1) in this list, because DSS always binds to localhost by default, in addition to the listed IP addresses in the bind_ip_addr pref. Changes take effecrt when you restart the server.

You do not have to kill and restart the server if you make changes to the rtsp_port pref or the bind_ip_addr pref. The server will dynamically stop listening on old ports and IP address and start listening on the new ones if you send kill -HUP (SIGHUP). You must send kill using the root account, so you may use su or sudo. Example syntax would be:

```
sudo kill -HUP <pid>
```

Archived - Mac OS X Managed Client: Simple Finder Requires Authentication to Access Group Folder

Accounts that are configured to use the Simple Finder see an authentication dialog when selecting the Group Folder.

Products Affected

Mac OS X Server 10.3

This article has been archived and is no longer updated by Apple.

Symptom

An Apple Filing Protocol (AFP) authentication dialog appears when selecting the Group Folder.

This happens to accounts that are configured to use the Simple Finder.

Solution

If you want the Group Folder to automatically appear at login, use the Finder instead of Simple Finder.

Mac OS X Server 10.2: NFS Export to Subnet Fails When Incorrect Addressing Is Used

- **Last Modified:** October 24, 2003
- **Article:** TA28484

- **Old Article:** 107677

After configuring an NFS export to subnets, clients will only be able to mount when the network administrator has implemented a proper address scheme for the clients. This includes assigning a proper subnet range of IP addresses and an appropriate subnet mask to the clients.

Products Affected

Mac OS X Server 10.3

Symptom

After configuring an NFS export to subnets, clients are unable to successfully mount them.

Solution

The network administrator must be sure the network's IP addressing scheme is designed and implemented correctly. Client computers must be assigned an address that is part of a proper subnet range, and be given a correct subnet mask.

Macintosh IIvx: Displays Larger than 14 Inches

Why doesn't the Macintosh IIvx support monitors larger than 14 inches?
This article has been archived and is no longer updated by Apple.
The Macintosh IIvx (Performa 600) has internal video support for the 12-inch, 13-inch, 14-inch, and VGA (Video Graphics Array) displays. However, the internal video doesn't support monitors greater than 14 inches.

Macintosh IIvx video logic is based on the Macintosh LC II. Time to market urgency made major alterations of the Macintosh LC ASIC impossible.

Customers must purchase an appropriate NuBus Card such as the Macintosh Display Card 8*24 to drive their larger monitors.

Mac OS X Server 10.2: Server Status Does Not Connect After Changing Language Preference

- **Last Modified:** October 24, 2003
- **Article:** TA28486

- **Old Article:** 107681

If you save your Server Status connections in a keychain, the saved connections may not work after changing the preferred language in International preferences (from Japanese to English, for example).

Products Affected

Mac OS X Server 10.3

Symptom

Server Status does not reconnect after changing the preferred language in International preferences.

Solution

Re-enter the connection information for each saved server.

MacTCP 1.1: Internet Address Range 192.0.0.rrr Reserved

- **Last Modified:** October 04, 2008
- **Article:** TA28508

- **Old Article:** 10794

This article has been archived and is no longer updated by Apple.

I have a problem with MacTCP 1.1 and applications based on MacTCP, such as NCSA Telnet 2.5 and Oracle for Macintosh OS.

My network number was 192.0.0.rrr; that's the default class C network in MacTCP. Changing the network number made everything work properly.
This isn't a bug. According to RFC 1166 (page 47), internet addresses in the range 192.0.0.rrr are reserved. MacTCP knows this, doesn't allow this address to be used, and issues a "bad ip or LAP configuration error" (error id = -23001).

Addresses in the range 192.0.0.rrr are valid, but they are reserved.

MacTCP, MacTCP 1.1.1 inclusive, does have a problem in that it doesn't allow the use of internet addresses in the range 192.0.1.rrr. We have reported this problem to the MacTCP engineering team.

For a complete list of assigned and reserved internet addresses, please see pages 7 through 100 of RFC 1166.

iLife '04 updates you need for iTunes 4.7.1 or QuickTime 6.5.2

- **Last Modified:** June 29, 2007
- **Article:** TA28511

- **Old Article:** 107969

After upgrading to iTunes 4.7.1, you will need QuickTime 6.5.2 to use iTunes Store content outside of iTunes. iLife '04 applications also need to be updated to the versions listed below or later.

Products Affected

iMovie, iPhoto, GarageBand, iDVD, iTunes

If you have iLife '05, then these updates aren't necessary. Check Software Update to see if there are any updates available for iLife '05 applications.

iTunes 7.x is now available and requires QuickTime 6.5.2 or later.

To be sure you can use all iLife applications and features, simply update your QuickTime software and all iLife applications to these versions or later:

iDVD 4.0.1
http://www.apple.com/support/downloads/idvd401.html

iMovie 4.0.1
http://www.apple.com/support/downloads/imovie401.html

iPhoto 4.0.3
http://www.apple.com/support/downloads/iphoto.html

iTunes 4.7.1
http://www.apple.com/itunes/download

Note: Updates to these applications are offered at no charge for iLife '04 licensees.

Apple File Exchange and Macintosh PC Exchange: A Comparison

- **Last Modified:** November 04, 1992
- **Article:** TA28512

- **Old Article:** 10797

This article provides an overview of Apple File Exchange and Macintosh PC Exchange, and compares the two products.

Apple File Exchange Overview

Apple File Exchange is a file translation utility that converts a file from one format to another. For example, Apple File Exchange can take a DOS-formatted file and translate it to a Macintosh format. The file can then be opened by Macintosh applications designed to read the format into which the file has been translated.

Macintosh PC Exchange Overview

Macintosh PC Exchange is a software product that lets Macintosh computers, running System 7 and equipped with an Apple SuperDrive or a third-party 5.25-inch MS-DOS-compatible disk drive, easily read, write, and format DOS disks. DOS files appear on the Macintosh desktop just like Macintosh documents, and can be opened, saved, renamed, moved, copied, or deleted. The DOS file format is in no way altered by Macintosh PC Exchange. The application that you specify to open a DOS file must be able to read that DOS file format.

Apple File Exchange and Macintosh PC Exchange: A Comparison

Macintosh PC Exchange is an easier and more intuitive method for opening DOS-format disks. Macintosh PC Exchange also lets the Finder handle DOS files in the same manner as Macintosh files. The main differences between Macintosh PC Exchange and Apple File Exchange are:

* Macintosh PC Exchange is activated when you start up your Macintosh and automatically recognizes a DOS-format disk when it's inserted in an Apple SuperDrive. Apple File Exchange is a separate utility that must be manually launched every time you want to read a DOS disk.

* Macintosh PC Exchange lets you manipulate DOS files in the Finder, just like other Macintosh documents. It also lets you pre-assign the application to open when you double-click a DOS file. Apple File Exchange cannot automatically launch an application when a DOS file is double-clicked.

* Apple File Exchange comes with three special translator files that let you translate documents between Macintosh and DOS file formats. Macintosh PC Exchange doesn't contain any document translation capabilities.

iPod mini: Conflicting "do not disconnect" and "connect" messages during a software update

Products Affected

iPod, iPod mini

This article has been archived and is no longer updated by Apple.

Under certain circumstances, you may see the "do not disconnect" screen on your iPod mini, while the updater application on your computer is telling you to connect the iPod mini to AC power to complete the upgrade process.

This can happen in this situation:

- The iPod mini already has iPod software 1.1 installed.
- It is connected to a Windows PC via USB.
- You try to restore it with the same 1.1 software, which is included in iPod Updater 2004-04-28.

The solution is to disconnect the USB and connect to AC power to complete the upgrade process. (The message on the iPod mini is incorrect.)

Apple IIe Card: Requires SW Ver. 2.2.1 with System 7.1 (7/94)

If I upgrade my Macintosh LC II with an Apple IIe Card to System 7.1, what version of software do I need for the Apple IIe Card?

This article has been archived and is no longer updated by Apple.
To use the Apple IIe Card on a Macintosh LC II, Macintosh LC III, or Performa 400 series running System 7.1 or System 7.1P, you need version 2.2.1 of the Apple IIe Card software. You should upgrade to version 2.2.1 ONLY if you are using System 7.1.

Any error listed "Error Type 1" through an "Error Type 4", an error 10019, a "defective card error", and/or a partial screen in the IIe mode are indicators of the incorrect version of the IIe Card software.

You can purchase a software upgrade kit to upgrade older Apple IIe card software.

Note

You can use the Apple IIe Card software version 2.2 with the original Macintosh LC, but it's not required.

System 7.1: Use MacTCP 1.1.1 or Later

- **Last Modified:** May 23, 2001
- **Article:** TA28530

- **Old Article:** 10810

I upgraded from System 7.0 to 7.1. Virtual memory worked fine in the past. But now, after enabling Virtual Memory, the system bombs on restart with an error message that the System File is damaged, and to use the Installer to fix it. Reinstalling doesn't help, but turning Virtual Memory off lets the system boot normally.

The Read Me file with System 7.1 says that I must upgrade to MacTCP 1.1.1. How do I get MacTCP 1.1.1?
The system file isn't really damaged. MacTCP 1.1 will cause this message to appear if it's installed. MacTCP isn't fully compatible with System 7.1, and you should upgrade to version 1.1.1 or later.

If you have MacTCP 1.1 or earlier installed on your Macintosh, remove it from your System Folder before you upgrade to System 7.1. The system will crash when you start up if you don't do this.

Which Version of MacTCP should I use?

Both MacTCP 1.1.1 and later are compatible with System 7.1.

MacTCP 1.1.1 and later versions offer better support for larger "Hosts" files and for extension products, such as:

* AppleTalk Remote Access (ARA)
* Serial Line IP (SLIP)
* Point-to-Point Protocol drivers (PPP)

As of November 1993, the current version of MacTCP is 2.0.4.

Changes to the Distribution and Update Process

With the release of MacTCP 1.1.1 and later versions, there are some changes in the distribution and update process. Depending on how you obtained earlier versions, the method of obtaining new versions varies:

* Current MacTCP site license users receive the MacTCP 1.1.1 update free of charge. Developers with MacTCP commercial distribution licenses and customers with MacTCP internal use licenses have been sent updates. Developers or customers with these licenses, who haven't yet received their update, should contact Apple Software Licensing.

* Purchasers of the single user license of MacTCP 1.1 from APDA can obtain the MacTCP Developer Upgrade Kit (R0446LL/A) for a fee from APDA. The upgrade kit is only for MacTCP 1.1 customers who don't presently have a MacTCP commercial distribution license or internal site license.

* Customers who received MacTCP as part of MacX will be updated through MacX 1.2 update programs. You can order the MacX 1.2 update see your local dealer. This upgrade is for MacX 1.0, 1.1, or 1.1.7 and A/UX customers. Proof of purchase is required.

* MacTCP 2.0.2 is available on the price list as TCP/IP Connection for the Macintosh, or TCP/IP Administration for the Macintosh.

* MacTCP 2.0.4 is an update in a patch to update MacTCP 2.0.2.

* Purchasers of a commercial retail product that included MacTCP should contact the product's developer for details of any updates they may offer.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

System 6.0.8L: ReadMe File (8/95)

System 6.0.8L was a limited maintenance release of system software for markets in Apple Pacific. It was engineered to address some special needs for those markets that did not have access to System 7 at the time.

The following is the Read Me file included with the software.

This article has been archived and is no longer updated by Apple.
UPDATE

SYSTEM SOFTWARE VERSION 6.0.8L

For the Macintosh Classic II and Macintosh PowerBook 100

What is version 6.0.8L?

System software version 6.0.8L allows you to use System 6 on your computer while sharing a network with System 7 users. As the L in the version number indicates, this software runs on a limited number of computers. It is primarily intended for the Macintosh Classic II and Macintosh PowerBook 100. However, it also runs on the Macintosh Classic, Macintosh LC, and Macintosh LC II. System software version 6.0.8L does not work on any other Macintosh computers.

Before you install version 6.0.8L

Before using the Installer program to install system software version 6.0.8L, be sure to remove any virus detection or security programs from your System Folder. After you have installed version 6.0.8L, you can reinstall those programs. If you are running system software version 7.0 or later on your computer, you should start up your computer using the 6.0.8L System Startup floppy disk and remove the System 7 System Folder from your hard disk before installing version 6.0.8L on your hard disk.

If you install a version earlier than 6.0.8L

If, after having installed version 6.0.8L on your hard disk, you decide to install an earlier version of system software, you must first remove the version 6.0.8L System Folder from your hard disk.

Sharing a LaserWriter on a network

If you upgrade to system software version 6.0.8L and you are on a network of shared LaserWriter printers, everyone on your network should upgrade to version 6.0.8 or 6.0.8L, or to System 7. If someone prefers not to upgrade their system software, they should at least install the new printing software using the Customize option in the Installer program found on the 6.0.8L System Startup disk. If someone prints on a network with a version of printing software earlier than 6.0.8, the printer must stop and "initialize" for that earlier version each time it's used. This slows down the printing process for everyone.

Using a Personal LaserWriter LS

In order to print with a Personal LaserWriter LS, you will need to upgrade your Personal LaserWriter LS driver to version 7.1.1 or greater. To obtain an upgrade for this driver, call the toll-free Apple software upgrade line, 800-947-5176, or pick up a mail-in upgrade coupon from your Apple dealer.

Using a LaserWriter IIsc

The Personal LaserWriter SC printing software replaces the earlier LaserWriter IIsc software. When you upgrade your system software to version 6.0.8L, the Installer automatically replaces the LaserWriter IIsc software with the Personal LaserWriter SC software. The new software works with both the Personal LaserWriter SC and the LaserWriter IIsc.

Differences between System 6 and System 7

A number of things in system software version 6.0.8L work differently than they do in System 7. Some System 7 features are not available in System 6. Some System 7 features are different from equivalent features in System 6.

These are System 7 features that do not exist in version 6.0.8L:

- the Help menu

- the Views control panel

- outline views of folders

- keyboard navigation in the Finder

- aliases

- file sharing

- virtual memory

- stationery pads

- custom icons

- Startup Items and Apple Menu Items folders

- automatic updating with publish and subscribe

- labels for icons in list views

- the ability to open and save documents on the desktop using the Open and Save dialog boxes

These are System 7 features that work differently in version 6.0.8L:

- the Application menu (in System 6 you use the MultiFinder icon instead)

- the System Folder's organization of files

- desk accessories

- fonts and sounds

- control panels

- the Find command (in version 6.0.8L you use the Find File desk accessory instead)

- the timing of when the Trash is emptied

Where to get a manual for System 6

To get complete documentation for system software version 6.0.8L, you can ask your Apple dealer for a copy of the Macintosh Reference (part number 030-4015-B). Your dealer can order that book for you. The Macintosh Reference and this update together contain all of the information you need to use system software version 6.0.8L.

A/UX: "bad sblock magic number" Error When Backing Up

- **Last Modified:** November 11, 1992
- **Article:** TA28609

- **Old Article:** 10944

When creating a backup of an A/UX filesystem, I get the following message:

DUMP: bad sblock magic number
DUMP: The ENTIRE dump is aborted.
The dump.bsd command takes as its last argument the raw device file, rather than a block device (directory name). For all filesystems except the root filesystem, dump.bsd will look up the block device in /etc/fstab and use the raw device file listed there.

This error can be reproduced as follows:

```
# dump.bsd 0f /dev/null /
DUMP: Date of this level 0 dump: Wed Oct 21 12:29:00 1992
DUMP: Date of last level 0 dump: the epoch
DUMP: Dumping / to /dev/null
DUMP: bad sblock magic number
DUMP: The ENTIRE dump is aborted.
```

Replacing the block device with the raw device in the example above will allow the dump.bsd command to execute correctly:

```
# dump.bsd 0f /dev/null /dev/rdsk/c0d0s0
DUMP: Date of this level 0 dump: Wed Oct 21 12:43:56 1992
DUMP: Date of last level 0 dump: the epoch
DUMP: Dumping /dev/rdsk/c0d0s0 to /dev/null
DUMP: mapping (Pass I) [regular files]
DUMP: mapping (Pass II) [directories]
DUMP: dumping (Pass IV) [regular files]
```

Configuring the ImageWriter to an Apple III or III+ (10/94)

The following information shows how to configure an Apple /// and an ImageWriter II printer.

This article has been archived and is no longer updated by Apple.

Interface:

You may use either the .PRINTER driver or the .RS232 driver. The appropriate data configuration blocks for these drivers are:

.PRINTER: [0E] [00] [00] [00] [00]
.RS232: [0E] [00] [00] [00] [00] [00] [13] [11] [DF] [84] [50] [80]

Cables:

Modem Eliminator Cable (Part #590-0166)
Serial and Communications Cable (Part #590-0037)

Printer Switch Settings:

8 7 6 5 4 3 2 1
SW1: | | |X| | | | |
|X|X| |X|X|X|X|X|

4 3 2 1
SW2: | | |X|X|
|X|X| | |

NOTE: These switch settings are for the U.S. character set, 66-line page length, 8 data bits, elite pitch, no auto-LF after CR, 9600 baud, DTR data protocol. If you wish to change any of these settings, you must make corresponding changes in the data configuration block for whatever printer driver you're using.

Search on "Imagewriter and switches" and/or "driver data configuration" for more information on configuring.

Macintosh PC Exchange: Symptoms of INIT Conflicts

- **Last Modified:** April 30, 1993
- **Article:** TA28613

- **Old Article:** 10953

What kind of symptoms are usually associated with INIT conflicts when using Mac PC Exchange?

Here are some typical symptoms of INIT conflicts:

* System won't mount a correctly formatted DOS disk without being told that it's unreadable.

* Can't open the Macintosh PC Exchange control panel to make changes.

* System freezes when mounting a correctly formatted DOS disk.

Macintosh PC Exchange: PC Icon on a Hard Disk

- **Last Modified:** April 30, 1993
- **Article:** TA28614

- **Old Article:** 10954

When I place the PC file onto the hard disk, I'm unable to assign a creator/type. The file always shows up as a PC icon and never takes on the icon of the application it's assigned to.

The assignment of the suffix to a creator/type applies to files that are on MS-DOS floppy disks only. Macintosh PC Exchange's creator/type selector won't access files you mount via a network, removable hard disk, or optical disk.

Macintosh PC Exchange: Apple 5.25-Inch Disk Drive

- **Last Modified:** April 30, 1993
- **Article:** TA28615

- **Old Article:** 10955

I have a Macintosh LC with an Apple 5.25-inch disk drive attached. When I put a ProDOS or MS-DOS disk in the drive, the computer doesn't mount it to the Desktop. Why ?

A Macintosh LC uses an Apple 5.25-inch disk drive in Apple IIe mode only. Macintosh PC Exchange is only active in Macintosh mode, and therefore won't be active. A Macintosh LC in Apple IIe mode won't recognize MS-DOS disks, and a Macintosh LC in Macintosh mode won't recognize ProDOS disks. When in Apple IIe mode, it should recognize ProDOS disks.

Macintosh PC Exchange: Losing Diacritical Marks

- **Last Modified:** April 30, 1993
- **Article:** TA28616

- **Old Article:** 10956

When I convert a foreign word processor or text file (German, Spanish, French), from a DOS application to the Macintosh application, the special accent characters change or disappear from the document. Why does this happen, and what can I do to resolve the problem?

Because Macintosh PC Exchange isn't a language translator, it's up to the specific Macintosh application to support the extended ASCII character set of the PC application. Be sure to use an application that supports these diacritical marks, so you won't lose them during the DOS-to-Macintosh translation of the document.

Macintosh PC Exchange: RESOURCE.FRK File Seen on PC

- **Last Modified:** December 11, 1992
- **Article:** TA28619

- **Old Article:** 10960

After using Macintosh PC Exchange, I see a RESOURCE.FRK file when I put it into the PC. The PC didn't generate this. What is it, and why is it there?

Macintosh PC Exchange creates a directory on the PC disk. Macintosh PC Exchange then installs resources to hold the information the same way it makes the Desktop files for the Macintosh volumes. This is normal and should be left alone if the disk will be used by the Macintosh. If you erase this file, Macintosh PC Exchange will recreate it the next time you insert the disk into a Macintosh.

PowerBook: Recharging Batteries

- **Last Modified:** September 08, 2006
- **Article:** TA28622

- **Old Article:** 10970

This article discusses proper methods for recharging PowerBook batteries.

Products Affected

PowerBook

All PowerBook models do not use the same kind of battery; it's important to know which type of battery you're using in order to recharge it properly.

It is also important to use the AC Adapter which came with your computer to ensure the maximum amount of power is available for charging and use. Using an alternative charger may extend charge times or cause damage to your PowerBook.

If your PowerBook will not recharge the battery, first ensure the AC adapter is plugged into a working outlet. If you have another charger, try it to see if the charging status changes. If not, it is possible that the battery itself is damaged. An Apple Authorized Service Provider can perform additional diagnosis to determine if the battery, AC adapter, or PowerBook itself is causing the trouble.

Apple uses four different types of batteries for PowerBook computers. PowerBooks since the PowerBook G3 use a Lithium Ion battery. To learn which type of battery is installed in an earlier PowerBook, read article 16168: **"PowerBook: Battery, Recharger & AC Adapter Identification"**

- Sealed Lead Acid (SLA)
- Nickel Cadmium (NiCad)
- Nickel Metal Hydride (NiMH)
- Lithium Ion (LiIon)

Each type of battery requires a different recharging technique to ensure maximum battery life.

Sealed Lead Acid
Recharge sealed lead acid batteries whenever they become depleted and never fully discharge the battery. Lead acid batteries should always be kept fully charged.

If a lead acid battery becomes fully discharged, it may experience sulfation. Sulfation occurs when the lead electrodes inside the battery convert to lead sulfate. This destroys the battery making it unable to hold a charge.

Nickel Cadmium
Recharge nickel cadmium batteries when they become depleted. Apple recommends fully discharging and recharging the battery approximately every 90 days.

Nickel cadmium batteries are subject to an issue known as "memory effect." If a NiCad battery is only partially discharged then recharged many times, it will begin to "remember" the level it was discharged to and won't fully recharge.

Here's an example: Let's assume your PowerBook battery has a normal capacity of 2.5 hours and you use your PowerBook for 1 hour a day, then recharge the battery overnight. After a period of time, approximately between 30-90 days, you'll discover that your battery now has a capacity of a little over an hour, instead of 2.5 hours.

The only way to recover the battery's full capacity is to fully discharge it, then fully recharge it.

Nickel Metal Hydride
Recharge nickel metal hydride batteries when they become depleted. Fully discharge and recharge the battery approximately every 30 days.

Nickel metal hydride batteries are also subject to "memory" and should be treated like nickel cadmium batteries.

How to fully discharge NiCad and NiMH Batteries
The best way to fully discharge NiCad or NiMH PowerBook batteries is to use your PowerBook normally, but to ignore the low-power messages that appear on the screen. Be sure, however, to save your work frequently. When the computer goes to sleep automatically, recharge the battery completely before using that battery again.

Length of time to recharge
Allow plenty of time to recharge a battery. It may take six to eight hours to completely charge a battery on some PowerBook models, longer if you're using the computer.

When you use the power adapter to run the computer and recharge the battery simultaneously, the battery may not be completely recharged during your work session. It's a good idea to leave the adapter plugged in overnight occasionally to assure that the battery is fully charged.

Here are some ways to recharge a fully depleted battery, from fastest to slowest:

- In an external recharger (one battery)
- In the computer while shut down
- In the computer in sleep mode
- In the computer while working

Lithium-ion
You can recharge Lithium-ion batteries anytime the battery meter reads less then 95%.

Macintosh Quadra 700, 900: Built-In Video

- **Last Modified:** October 04, 2008
- **Article:** TA28634

- **Old Article:** 10992

This article has been archived and is no longer updated by Apple.
This article, by the designer of the Macintosh Quadra's video hardware, discusses a number of general Quadra video topics.
The Quadras were designed with a flexible video hardware section to support a wide variety of displays. Since the purchaser of one of these systems is paying for a frame buffer on the logic board (whether (s) he wants it or not), and since the Quadras were designed to be high-performance machines, the frame buffer was designed to be both very flexible (to support most displays a user may want to use) and to be high performance (to match the computer's capabilities).

Obviously, every display made by every third-party monitor vendor can't be supported by the built-in video, but the Quadras do support a much wider range of displays at a higher level of performance than any previous Macintosh. The Quadra 700 and 900 support pixel depths ranging from 1 to 32 bits per pixel (bpp), Apple displays ranging from the 512 x 384 12-inch color monitor through the 1152 x 870 21-inch color monitor, pixel clocks ranging from 12 to 100 MHz, and a variety of industry standards such as VGA, SVGA, NTSC, and PAL. The Quadra video port produces RS-343 RGB, and provides horizontal, vertical, and composite sync outputs.

Composite or S-video output is not provided, but can be accomplished by use of an external RGB-to-composite encoder. The Quadra 700 and 900 also support Apple convolution for flicker-reduction on interlaced displays (i.e., NTSC and PAL) at up to 8 bpp. The Quadras automatically detect the type of display attached to the video connector via three 'sense' pins on the video connector. Depending on the wiring of these three pins, software in ROM configures the video hardware for one of the supported display types. (A full description of sense pin wiring and supported display types is in another article.)

The Quadra series provides the highest built-in video performance of any Macintosh to date. In a (very) simplified graphics model, we could say that performance depends on two main factors: processor horsepower and the bandwidth the processor has into frame buffer memory. These systems already have a fast processor-- the 68040-- which runs standard 32-bit QuickDraw.

To provide high bandwidth into frame buffer memory, dedicated video RAM (VRAM) was used for the frame buffer, and that VRAM was placed directly on the 68040 processor's local bus. This provides the 68040 the same access time into frame buffer memory that it has into main system RAM. (Transfer rates can exceed 40MB/sec.) In addition, memory options such as fast page mode are supported, which can improve graphics performance for operations such as scrolling, offscreen-to-onscreen pixmap transfers, etc.

In several cases the design was optimized for high performance over low cost. A good example of this is 32 bpp operation on Apple's standard 13-inch RGB monitor at 640 x 480 resolution (and this also applies to VGA and NTSC), which is probably the most common color monitor in use on the Macintosh. The actual number of memory bytes needed to support 24 bpp is 640 x 480 x 3 = 921,600. This would seem to fit within 1MB of memory (as is true with the Macintosh Display Card 8*24), but the Quadras actually require 2MB of VRAM for this mode.

The 8*24 card supports 24 bpp at 640 x 480 by using a storage mode called 'chunky planar' to use all its 1MB of VRAM. However, this results in having to perform three separate memory accesses for each 24-bit pixel read from or written to the frame buffer. (This is done in hardware, so software only performs a single read or write.) On a NuBus video card, this inefficiency is partly masked by the synchronization delays which occur at the processor-bus/NuBus interface. However, when frame buffer memory is placed directly on the processor bus, this approach results in a nearly 3x performance degradation.

This was judged unacceptable for the Quadras. Each 24-bit pixel occupies one longword (4-bytes) in VRAM, so the Quadras actually provide 32 bpp for the 640 x 480 resolution. This pushes the memory requirement for this mode over the 1MB boundary (640 x 480 x 4 = 1,228,800 bytes). Performance is improved still more by another frame buffer architectural feature. Frame buffer memory in the Quadras is organized into 4 'banks' of 512 K per bank. As mentioned earlier, Quadra VRAM can operate in fast page mode. In addition, each bank of VRAM operates in fast page mode independent of the other 3 banks. This causes in-page 'hits' to increase, and improves the effective bandwidth into the frame buffer. Also, at 32 bpp, 640 x 480 resolution, each row is set to 4096 bytes, or 1024 32-bit pixels. Each successive row is assigned to a different VRAM bank (modulo 4).

This memory organization commonly improves performance during certain performed graphics operations such as vertical scrolling.

In any design there are several tradeoffs to be made, and this is certainly true for the frame buffer in the Quadras. While the video does operate at 32 bpp on up to 16-inch displays, it does not support 21-inch displays at this pixel depth since this would have greatly raised the cost of the main logic board. (Memory capacity and bus bandwidths would essentially have to double, and this would be expensive.) It does support NTSC and PAL timing, but does not provide a composite video output. While it is much faster than any non-accelerated video card, there are accelerated video cards that are faster (and more expensive).

A separate graphics processor was not added primarily for cost reasons. However, a graphics processor such as the 29000 RISC chip on the Display Card 8*24 GC can only speed up the graphics operations that it was designed to know about. If an application program bypasses QuickDraw (which is what most Macintosh graphics accelerators are designed to speed up), a graphics accelerator will not improve performance, and can actually cause a performance degradation.

Overall, the Macintosh Quadra video provides a reasonable compromise of cost, performance, and features, which provide the video needed by most Macintosh users at a reasonable price.

SNMP Technical Introduction, Part 2 of 3

- **Last Modified:** November 24, 1992
- **Article:** TA28649

- **Old Article:** 11016

This is the second of three articles that introduce SNMP (Simple Network Management Protocol). This article describes SNMP's history, management model, and architecture.

SNMP History

Simple Network Management Protocol (SNMP) originated in the Internet community as a means for managing TCP/IP networks and Ethernet networks.

Every large network sooner or later displays a need for management and control, and the worldwide TCP/IP Internet is no exception.

In November 1987, a working group of the Internet Engineering Task Force (IETF) submitted a proposal to address some of these needs. They defined the Simple Gateway Management Protocol (SGMP), an early attempt at TCP/IP Internet management, and the forerunner of SNMP. SGMP is similar to SNMP in design and architecture, however syntax differences make the two incompatible.

In August 1988, the same four authors enhanced their proposal, and submitted a draft standard (Request For Comments 1098 entitled "A Simple Network Management Protocol"). RFCs are a method of defining and discussing enhancements to the Internet.

One of the main design criteria was simplicity. Another was to make the monitoring and control capabilities quite extensive. Due to the variety of devices on the Internet, the authors wanted to create an architecture independent of any specific host/gateway architecture.

In April 1989, RFC 1098 became an Internet Recommended Standard, and was rapidly implemented on the worldwide Internet.

SNMP's appeal broadened rapidly beyond the Internet community. SNMP attracted users looking for a proven and readily available way to manage their networks. SNMP's monitoring and control mechanisms operate

completely independent of the TCP/IP protocol. SNMP requires only the datagram transport mechanism to operate. It can be implemented over any network media or protocol suite, including AppleTalk.

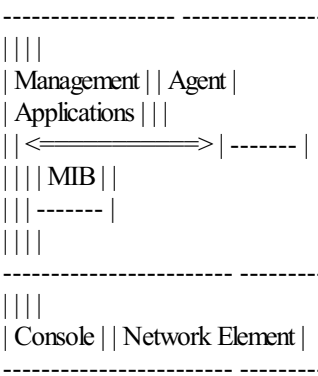
In May 1990, RFC 1098 was re-released, with typographical errors corrected, and a rewritten status section. RFC 1157 is the basis for Apple's network management strategy.

The Management Model

A network management system contains three main components:
* Several network elements, or nodes, which need to be managed.
* At least one management station used to administer the network.
* A management protocol that is used to communicate between the nodes and the manager.

SNMP Architecture

The SNMP architecture conforms to this management model. It defines these three major components: managed nodes (network elements), at least one network management station (console), and a protocol to communicate between the two. The diagram below displays this relationship in SNMP.



Network Elements (Nodes)
Network elements are devices such as hosts, gateways, terminal servers, and desktop computers. They are also known as managed nodes, nodes, or "entities." Network Elements can also be hubs or multiplexors. Although simple in concept, the network elements actually perform most of the work in SNMP, and contain all the information a management console needs to perform its function.

Consoles
Consoles are the management stations. They execute management applications to monitor and control network elements. They display, often graphically, the state of the current network and any alarms present.

The Protocol
SNMP is used to communicate management information between the network management stations and the agents in the network elements.

Inside the Network Element (Node)
Agents. Network Elements have agents responsible for performing the functions requested by the network management stations. Agents do the real work in SNMP management. Agents execute commands issued by the console, as well as reporting on unusual events.

Agents control and provide access to a Management Information Base (MIB), which contains the information to respond to console requests and updates.

Overview of the MIB

SNMP depends on the relationship between the console, agents, and the MIBs and agent controls.

The MIB contains groups, which are collections of objects.

Objects define data types, such as text strings, counters, gauges, time ticks, addresses, and integers. Each object has a unique name. (The naming convention used is discussed in the next section.)

The data fields that objects define are called variables. These are the fields where the actual data or value is stored. Each variable also has a unique name, using the same convention as the objects.

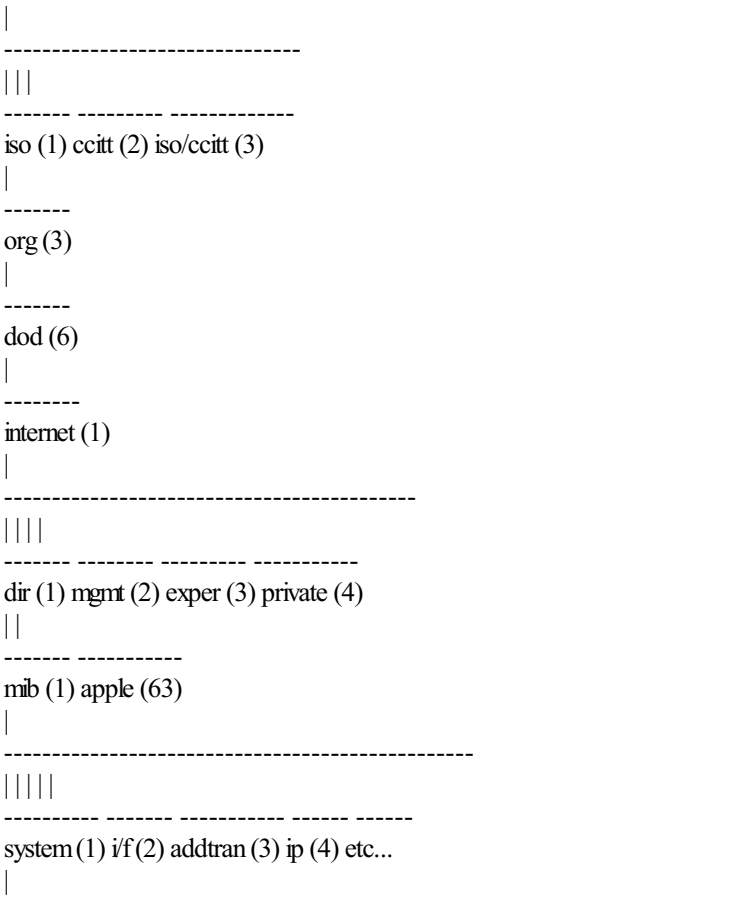
MIBs are encoded using OSI's Abstract Syntax Notation One (ASN.1). This language is used to define the objects in the MIB. ASN.1 is an international standard, implemented by most of the world's computer manufacturers. ASN.1 encoding makes the MIB platform independent.

The Structure and Representation of MIB Objects and Variable Names

Names used for MIB objects and their variables are taken from the object identifier namespace, administered by ISO and CCITT. The key idea behind the object identifier is to provide an environment in which all possible objects can be uniquely named.

Authority for parts of the namespace is subdivided at each level, allowing individual groups to assign names without consulting a central authority for each assignment.

This tree structure is used to identify each and every MIB object, and in fact they are accessed programmatically using this structure.



sysDesc (1)

In the figure above, each item has a number associated with it. These numbers correspond to specific paths to locate information in an SNMP network element, and give each object a unique name. For example, the unique name for the object that contains the system description (machine type) of the network element is described as:

iso.org.dod.internet.mgmt.mib.sys.sysDesc

The number representation of the above map is:

1.3.6.1.2.1.1.1

SNMP consoles actually use the number string to address the objects in the packets that travel the network, and in the programs used to construct the packets. Although this number string addresses the object, it is not enough to address the first variable containing the data or value, which is the number the console really wants.

There are no zeros on the map because a zero is used to reference the actual data (value) of a variable.

To obtain a value from the object named sysDesc, add a zero to the number string. Therefore, a Get command would use 1.3.6.1.2.1.1.1.0 to obtain this value. An example of a response would be the text string "Macintosh IIx."

A significant benefit of this architecture is that it allows the development of consoles that can manage the products of many different vendors -- because all the objects are unique. Generic SNMP consoles, which often know little or nothing about specific manageable network devices, incorporate, or are able to import, MIBs because the coding and data representation rules are standardized, and the object names are preassigned and unique.

One of the main features of SNMP is allowing vendor-specific implementations of the MIB. Non-standard, vendor-specific MIBs would come under the Enterprise branch of the object identifier namespace. Organizations, such as Apple, can apply to the Internet Activities Board (IAB) for specific Enterprise numbers to keep their MIBs unique. Apple Computer's Enterprise number is 63, and over 100 other companies have applied for unique numbers, to provide an indication of how many vendor-specific MIBs will be implemented over time.

Consoles can compile imported MIBs and issue commands to agents. These consoles then display, often graphically, the information returned by the agents. Because these generic consoles are not product specific (MIBs are) they can even be used to manage network products that ship after the console itself is sold.

AppleCD 300: New Features Require Application Support

- **Last Modified:** December 08, 1992
- **Article:** TA28667

- **Old Article:** 11038

How do I access the CD+G, CD+MIDI, and CD-XA file formats of the AppleCD 300 family of CD players? When I play a CD+G compact disc, the audio portion plays easily, but the graphics never appear.

The ability to access the various CD formats provided in the AppleCD 300 family requires a software application that can send the appropriate instructions to the AppleCD 300.

The same situation exists with the ability to play standard audio CDs on an Apple CD-ROM drive: you must have CD Remote (or a similar piece of software) to allow an Apple CD-ROM drive to play audio CDs. The general principle is that if a software application does not support a particular feature, that feature is unavailable.

At the announcement of the AppleCD 300, there are no available applications that provide access to the CD+G, CD+MIDI, and CD-XA features of the AppleCD 300 series.

Macintosh: 16-bit to 8-bit Audio Conversion

- **Last Modified:** December 08, 1992
- **Article:** TA28668

- **Old Article:** 11039

I'm recording some voice audio files to be played back into MacroMind Director. I record them in 16-bit audio with digidesign's AudioMedia card. I convert the files to 8-bit audio with MacroMedia's SoundEdit Pro. The converted sound is very low quality.

I realize that 8-bit has a smaller dynamic range than 16-bit, but the noise added isn't just a steady noise. The noise is a hissing sound that seems to rise and fall with the speakers voice.

Is this sound degradation expected? Are other programs or sound formats better at converting 16-bit to 8-bit audio? Are there any steps I can take to reduce this noise?
Downsampling (moving from 16-bit to 8-bit and moving from 44.1 KHz to 22 KHz) is strictly a software operation. Therefore, it's the method of changing from one bit-per-sample/sample rate format to another that is introducing the noise.

Downsampling only the bits (16-bit to 8-bit) is generally not the part of the sequence that introduces the most noise. Although, any method of changing the bit-per-sample count will cause a change of character in the sound. The conversion from 44.1 KHz sampling rate to a 22 KHz rate creates the most opportunity for major introduction of noise. The downsampling of sample rates is more an art than a pure science; thus, different programs could easily produce quite different results.

We discussed the issue of using SoundEdit Pro for this procedure with the MacroMedia Tech Support group. They suggested that the downsampling take place within the software package where the sampling originated. For example, if the original digital recording is in AudioMedia's Sound Designer, downsample in Sound Designer. Then use the resulting sound file in SoundEdit Pro and MacroMind Director.

Degradation should be expected during the downsampling. The exact form it takes will be based on which hardware/software elements are used to perform the task. Many sound engineers who must work with 8-bit sound record the

original digital recording in 8-bit. This provides far less room for error than recording in 16-bit sound and then converting to 8-bit.

The introduction of noise isn't related to the file format, unless compression (that is, MACE) is used when the file is saved. Compression can easily add noise, and should be expected when compressing.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

Macintosh: Fonts and System File Memory Allocation

Why doesn't deleting 600K of fonts make my system file allocate 600K less memory? When I look at "About this Macintosh" the system file has allocated only 100K less memory than before deleting the fonts.

This article has been archived and is no longer updated by Apple.

The system usually loads fonts into memory when an application uses the fonts. So even though you removed 600K of fonts, the fonts you weren't using weren't loaded into memory and have no impact on memory allocated for the system file.

Published Date: Feb 19, 2012

Archived - MS-DOS External 5.25-inch Floppy Drives: Macintosh Compatibility

01/21/93 - REVISED
* To include information about Macintosh
MS-DOS compatible floppy drives

Are MS/DOS external 5.25-inch floppy drives compatible with Macintosh computers?

This article has been archived and is no longer updated by Apple.
No, MS-DOS external 5.25-inch floppy drives are not compatible with Macintosh computers. An MS-DOS external 5.25-inch floppy drive is a device that attaches to a MS-DOS computer and reads 5.25-inch diskettes.

Macintosh computers must receive information on mounted disks. A key system call that gathers this information, DiskInPlace, is not supported by MS-DOS floppy drives.

Also, MS-DOS external floppy drives do not have the same pinouts as Macintosh drives.

There are Macintosh-compatible external floppy drives which DO attach to some Macintosh computers and read 5.25-inch MS-DOS diskettes. These floppy drives are designed to connect to Macintosh computers, not to MS-DOS computers. Two examples are:
* the Apple PC 5.25 Floppy Drive, made by Apple Computer
* the DaynaFile, made by Dayna Communications.

Additional Product Support Information

System 7: Performa Versions Compared

This article describes the progressive changes made to system software versions 7.0.1, 7.0.1P, 7.1, 7.1P, 7.1P1, 7.1P2, 7.1P3, 7.1P5, 7.1P6, and System 7.5.
This article has been archived and is no longer updated by Apple.

SYSTEM SOFTWARE VERSION 7.0.1

Here are the features of system software version 7.0.1 that 7.0 doesn't have:

Extensions

* Memory - Included RAM Disk, and updated virtual memory and RAM Cache to work with new RAM disk.
* Portable - Removed screen brightness and contrast sliders, and RAM disk.
* Brightness - A simple slider to control screen brightness. * Network - Support for on-board Sonic Ethernet for the Quadra family.
* Battery - Updated to work with PowerBook family.
* Caps Lock - Indicator panel available only on PowerBooks.
* File Sharing - Internal file sharing buffer increased from 4K to 5K.
* Cache Switch - For Quadras to disable or enable 68040 cache.
* A/ROSE and DAL - 68040 compatibility changes.
* HD SC Setup - Format-time mode select change.

System File

* Operating System
* Keyboard patch wakes up sleeping Macintosh Apple Keyboard II (Macintosh Classic) keyboards.
* Support for 53C96 SCSI chip in Quadras and PowerBooks 140 and 170, and for PowerBooks 140 and 170 power manager.
* Minor changes to LocalTalk (for 68040), Gestalt 'Iram', 'ram', and 'kbd' selectors (for RAM disk), _hwPriv CPU cache management and dispatch routines, keyboard maps (for PowerBook).
* Startup code can inhibit 68040 cache when Cache Switch cdev is set. * Bitmap system fonts marked purgeable.
* ToolBox
* SANE performance improved via backpatching.
* Disk Initialization Package prevents RAM disks from being formatted as MFS volumes.
* Notification Manager calls IdleUpdate when NMInstall called (on portables) to wake the system.
* Powerdown messages on Quadra 900 and RAM disk.
* Support for Quadra and PowerBook sound hardware. * Backlight driver upgraded to work with PowerBook family.
* SetHandleSize fixed for all 32-bit memory managers.

General

* Reduction in overall size of run time system heap.
* Installer script file revisions for new systems.

SYSTEM SOFTWARE VERSION 7.0.1P

System 7.0.1P is system software for the Performa 200 and 400. It's a modification of system software version 7.0.1 that makes changes to the Macintosh, simplifying the interface for new users. A control panel extension installs the system changes. This version uses the control panel portion of the file as a pseudo-Finder enhancement, for a push-button application launcher.

Here are the modifications:

* Generalized reference to the computer Instead of "About this Macintosh..." the Apple menu reads "About this Computer..." The window doesn't identify the specific model. Applications can use a Gestalt selector to determine whether 7.0.1P is running.
* Push-button program launching When a Performa starts up, the Launcher control panel opens on the desktop (like a small version of At Ease) with an icon for each installed application. You can launch an application with a single click.
* Layer hiding When launching an application, the Finder layer is hidden, giving the illusion that only one application is open at a time. Clicking on the desktop won't bring the Finder to the front. You can still switch applications through the Application menu.
* Default folders The internal disk on a Performa is configured with an Applications folder and a Documents folder on the desktop. The standard Save As dialog box is modified to always default to saving in the Documents folder. This keeps all documents together rath
er than with the application that created them.
* Color default On color-capable Performas, the default Monitors setting is 8-bit color.
* Changes in desktop pattern A modified General control panel replaces the standard desktop pattern editor with a pop-up menu containing a variety of 16x16 desktop patterns.
* Includes At Ease 1.0 Lets adults share the computer, and makes it easy for children to launch applications.
* Backup & Restore This provides an easy way to create a set of backup disks, and to restore the contents of the hard disk if necessary.

SYSTEM SOFTWARE VERSION 7.1

System software version 7.1 has the system enabler that supports the Macintosh IIvx and IIvi. It has the features described for 7.0.1 (minus DAL

and SANE backpatching), with the following additions:

* WorldScript software This simplifies language script support. * New control panels These allow customizing formats for dates, times, numbers, and text behavior (for example, sort and case conversion). Here's a list of the new control panels:

* Date & Time
* General Controls
* Numbers
* Text Control
* PowerBook

* Improvements made by System 7 Tune-Up 1.1.1 These improvements include resolving the problem of disappearing folders and files, and installing LaserWriter driver version 7.1.1.
* The QuickTime software extension This provides multimedia capability.
* Font folder This folder within the System Folder provides a single place to store all fonts.
* System Enablers These provide compatibility between Macintosh CPU hardware and system software. The Install Me First disk adds a software module, and not a whole new system.

SYSTEM SOFTWARE VERSION 7.1P
System software version 7.1P was created to support the Macintosh Performa 600 (but works with all Performa models). It has the features described for 7.1 and 7.0.1P, with the following exceptions:

* Includes Macintosh PC Exchange and the Apple IIe ProDOS extension. * Removes Apple File Exchange.

SYSTEM SOFTWARE VERSION 7.1P1
System software version 7.1P1 supports all the Macintosh Performa models, and has all the features described for 7.1, 7.0.1P, and 7.1P with the following exceptions: * Memory control panel The RAM disk memory could be set too high in version 7.1P. A change in the Memory control panel prevents this.
* Installs CD-ROM 4.0.2 and StyleWriter II drivers
* Pre-configures At Ease icons The application buttons appear automatically and don't require manual placement.
* System enabler modification There have been reports that the floppy drive sometimes won't eject disks. A modification to the system enabler corrects this.
* Minor interface changes There are a few cosmetic changes, like moving the Mouse Basics icon to the far left side of the screen.
* Serial driver for communications

SYSTEM SOFTWARE VERSION 7.1P2
System software version 7.1P2 supports all the Macintosh Performa models, and has all the features described for 7.1, 7.0.1P, 7.1P, and 7.1P1, with the following modifications:

* Eliminates the system freeze when you click on the sea horse in Mouse Practice. This was corrected by reducing the application preferred memory size from 5000K to 2500K.
* Allows setting Monitors control panel to any number of colors or black and white selection. The 7.1P1 version reset the system to 256 colors upon restart.
* Control panels "exercised" (opened and closed) during Custom Mac process

Many control panels normally have compressed resources. This makes it easier to fit all the necessary files on system software floppy disks. Once a control panel is opened, the resources are decompressed, and then written back to disk decompressed. This process can take quite a bit of time (minutes, on a Performa 400), and is most visible with the Monitors control panel.

If a user shuts down their system while the decompressed resources are being written back to disk, it can lead to problems. By providing users with control panels which already have decompressed resources, it should speed things up, reducing the risk that a customer might think something is wrong and want to shut down their system improperly.
* The Read Me document now very clearly provides information about the importance of the proper shut down procedure.

SYSTEM SOFTWARE VERSION 7.1P3
System software version 7.1P3 supports all the Macintosh Performa models, and has all the features described for 7.1, 7.0.1P, 7.1P, 7.1P1, and 7.1P2 with the following modifications:

* Includes a Shut Down desk accessory to make it easier to shut down, no matter what application is open. User studies showed that many users were confused about having to "go to the Finder" in order to shut down.
* Detects, during the startup process, if an improper shut down occurred. If it occurs (dirty bit was set), a dialog warns to always shut down properly.
* Performa control panel provides System Folder protection, preventing the user from deleting, renaming, or removing items from the System Folder. This feature is on by default, but can be turned off via the Performa control panel. * Performa Macintosh Basics provide detailed information about the importance of the proper shut down procedure.

* System and Finder version numbers changed to 7.1P3.
* FKEY 3 saves the PICT as a SimpleText file type instead of a TeachText file.
* Apple Restore 1.3 runs only if you start up with the Utilities disk. Provides additional room for error dialogs.
* Slight change in the patterns of General Controls 7.1P3.
* Launcher 2.0P version number change. Changed the icons for the Launcher Items folder and the Launcher. Finalized the About Box.
* Balloon help added to Performa 1.0. Replaced two check boxes for the documents saving options with three radio buttons in the Performa window. Performa control panel icon changed. Performa control panel checks for System 7.x before opening; if it detects a non-supported system, it passes an error to the Finder which displays a message. Displays an alert if Performa control panel is open even though INITs aren't properly installed.
* Finder Layer hiding, an extension in the Performa control panel, modified to never bring At Ease to the front. This solves problems where user launches a desk accessory from the Finder and is switched to At Ease when the desk accessory closes. Now it always goes back to the Finder.
* SimpleText 7.1P changed the minimum and preferred memory partition size from 256K to 512K to solve some problems with Photo CD and large images.

SYSTEM SOFTWARE VERSION 7.1P5
System software version 7.1P5 supports all the Macintosh Performa models, and has all the features described for 7.1, 7.0.1P, 7.1P, 7.1P1, 7.1P2, and 7.1P3 with the following modifications:

* Mouse Basics, Mouse Practice, Performa Basics, Sharing Your Computer, Why Back Up, 800-SOS-APPL, DOS Compatibility and Helpful Tips are compressed using Application VISE 2.1.1. This results in the fulfillment kit fitting on eight disks plus the Utilities disk versus nine disks plus Utilities.
* An alias to AppleCD Audio Player is in the Apple Menu.
* Includes the latest LaserWriter 300 and StyleWriter II drivers.
* Apple Restore 1.3 When Restore finishes (because all software is installed or the user quit early) the last dialog has a restart button instead of asking for the Utilities disk. This forces a restart, causing a rebuild of the desktop.
* Rolled in all Apple HD SC Setup 7.2.1 fixes.
* General controls 7.1P3 desktop default pattern is second instead of third pattern.
* Performa 1.0 fixed this bug: when saving a document in an open application with the Performa control panel window open, Performa preference settings reverted to saved settings.
* Cleaned up the "not shut down correctly" dialog in the shut down check, an extension in the Performa control panel.
* The standard file patch, an extension in the Performa control panel, now resolves aliases most of the time. When aliases don't resolve, an 'X' appears over the Performa icon during startup.
* Added a file icon for the desk accessory called Shut Down 1.0P.

SYSTEM SOFTWARE VERSION 7.1P6
System software version 7.1P6 supports all the Macintosh Performa models, and has all the features described for 7.1, 7.0.1P, 7.1P, 7.1P1, 7.1P2, and 7.1P3 with the following modifications:

* Backup Partition Software-automatically detects corrupted system folders When a bad System Folder is detected, the user is given the option to re-load another System Folder into their system.
* CD ROM Support-supports the AppleCD 300+, an all other Apple drives
* New Instructional Products Suite-adds a searchable hypertext glossary. It also provides paths for electronic as well as phone-based third party support.
* HyperCard 2.2 Player-Includes a number of HyperCard stacks to provide additional functionality, and supports sales of the HyperCard 2.2 development kit.
* Improved incorrect shut-down dialog.

**Improvements to Apple Backup and Apple Restore.
* Inclusion of the '040 cache switch-provides compatibility with certain '040 cache incompatible programs, such as the current version of Prodigy.
* Optimus Support
* Bug fixes to improve reliability.

System 7.5
System 7.5 is qualified for all 680x0 based Performa computers with at least 4MB of memory (8MB for PowerTalk or QuickDraw GX), and at least 8MB for any PowerPC based Performa computer (16MB for PowerTalk or QuickDraw GX).

SOFTWARE BUNDLE
The software bundle for the Performa 550 has dozens of updates including:

* ClarisWorks 2.1-Supports PowerTalk and has bug fixes
* ClarisWorks Education Sample files-Allows us to use this bundle for the Educator Advantage Program
* Mario Teaches Typing 1.3.1

Fixes crashing Performa bug and sound manager problems

* American Heritage Dictionary Font Fix
* Quicken 4 Release 6

Fixes recalculation and other bugs

* New ClarisWorks Tour
* To receive upgrade kits from Global Village has been revised to eliminate the confusing dialog box at install time.

This 694-0261 bundle is qualified to be used for the Marts/Catalog 410 and 466, and the CE/MM 460 and 475, the Performa 550 with the CD 300+. (M1982LL/A,M1985LL/A, M2156LL/A M1904LL/A, M2147LL/B) as well as the all Performa 570 series computers.

New bundles will be built at the end of February to support the rest of the Performa line. (M2157LL/A, M2154LL/A, M1981LL/A, M2155LL/A) In addition, these other bundles will have updated copies of Mavis Beacon Typing, DateBook Pro, TouchBase Pro, and DataViz translators.
Last Modified: Feb 19, 2012

Additional Product Support Information

PowerBook 100 External SuperDrive: Specifications

- **Last Modified:** October 04, 2008
- **Article:** TA28745

- **Old Article:** 11154

This article has been archived and is no longer updated by Apple.

This article gives technical specifications for the Macintosh HDI-20 External 1.4MB Floppy Disk Drive (PowerBook 100 External SuperDrive).

Recording Media
---
* Disk diameter: 3.5 inches (9.0 cm)
* Recording surfaces: 2
* Tracks per inch: 135 (5.31 per mm)
* Number of cylinders: 80

Capacity
---
* Formatted data:
1.4MB (MFM)
800K (GCR)
720K (MFM)
* Unformatted data: 1 or 2MB

Drive Characteristics
---
* Seek time (track-to-track): 3 milliseconds
* Settle time: 18 milliseconds
* Drive startup time: 800 milliseconds

Head Position Accuracy
---
* 30 micrometers

Interface
---
* Connects directly to the Macintosh PowerBook 100 HDI-20 floppy drive port, via the drive's attached interface cable.

Environment
---
* Operating temperature: 50 to 122í F (10 to 50í C)
* Relative humidity: 5% to 90% noncondensing
* Storage temperature: -40 to +149í F (-40 to +65í C)

System Requirements
---
* Macintosh PowerBook 100

Dimensions and Weight
---
* Height: 1.1 inches (28 mm)
* Width: 4.5 inches (115 mm)
* Depth: 7.0 inches (174 mm) not including attached interface cable
* Weight: 1.5 lb. (.68 kg)

Article Change History:
27 August 1993 - Revised storage temperature

ColorSync Software: Overview

- **Last Modified:** June 12, 2000
- **Article:** TA28746

- **Old Article:** 11155

This article provides an overview of the ColorSync software.
ColorSync is an extension to QuickDraw. It facilitates color conversion from the color space (method of mathematically describing a color) of one device to the color space of another device. It does this while maintaining consistent visual representation. In simple terms, ColorSync displays and prints the same image that it scanned.

The Major Difficulties in Reproducing Color
The physics of color presents a technical barrier, since delivering colored light is very different from delivering colored ink. Colors are described in device-dependent terms:

- RGB (Red, Green, Blue) for monitors and most scanners
- CMYK (Cyan, Magenta, Yellow, and Black) for most printers

Device-dependent descriptions cause the same blend on one monitor to display a very different color on a different monitor. While it is possible to map an RGB value to a CMYK value for a given pair of devices, this is not a practical solution because changing the devices changes the mapping, and therefore the result.

Different devices (scanner, monitor, printer) have different capabilities in delivering color. A color possible on one device may not be possible on another. Every device produces a different range of colors, or color gamut. The scanner, display, and printer each have a different color gamut. Colors that all three devices can produce present no issue. But colors that only one or two devices can generate require color matching.

The perceived color given by a specific value of RGB for an individual monitor can vary. Any RGB to CMYK mapping is not accurate over time. The solution for this issue is commonly called calibration.

Colorsync Architecture
ColorSync is a system extension that provides color matching capabilities to the existing QuickDraw graphics model. It provides three important features:

System-Level Support for Color Matching
All applications and peripherals can take advantage of it. All applications and imaging peripherals use the same scheme for color matching.

Support for Existing Applications
Some existing applications get color-matched printing without waiting for revised applications. ColorSync provides some new calls that enable applications to match to the display as well. This completes the entire picture -- matched input, display, and output.

Opportunities for Third Parties to Add Value
ColorSync uses the Component Manager, which lets third-party developers add value to the color-matching system. This was developed in conjunction with QuickTime to link a series of Apple or third-party color management resources and utilities.

How Colorsync Solves Color Matching Issues

Device-Independent Color
ColorSync was developed to solve the issues related to device-dependent color such as RGB and CMYK. ColorSync attempts to consistently represent colors (visually very similar or identical) across the three color gamuts. ColorSync uses device profiles to determine what colors a device can display, print, or scan (device color gamut).

ColorSync translates the colors that the originating device created for an image into a device-independent, and human perception-based color space, CIE XYZ. From the CIE-XYZ color space, ColorSync then translates the image into the color space of the destination device.

ColorSync uses the Apple Color High-Resolution RGB monitor as the default system profile or space. If you have a different monitor, you should use the ColorSync profile for that monitor in order for ColorSync to work properly. The ColorSync profile creates a device-independent color definition while maintaining compatibility with QuickDraw, which is RGB-based. You can select any monitor that has a profile installed.

Applications
There are three levels of ColorSync application support:

Support Level	Description
Printing Fidelity	Making the standard Macintosh call, DrawPicture, enables matching the source image to the printer. Applications that support this call provide printing functionality without revision.
Display Fidelity	ColorSync can correct for the display if the source is a scanner or a different monitor. The ColorPicker shows two gamuts, and you can choose those available on the monitor and printer or other display.
Preview Function	ColorSync lets applications offer a preview function that indicates those colors not possible on a particular device. Users can check documents before printing.

Device Profiles and Drivers
ColorSync allows characterizations of each device in terms of the CIE XYZ color space. These characterizations are called profiles. This allows making comparisons between any pair of ColorSync devices in terms of the common space.

Color Matching with ColorSync CMMs (Color Matching Methods)
CMMs give the best possible match when the exact match is not available. ColorSync uses the device profiles to determine if a device can display or print a certain color. If a color is outside the color gamut of a device, ColorSync determines a best-match color within that device's gamut. It uses a simple look-up table or an algorithmic calculation to do this. The table look-up method is much faster than the algorithmic method.

The algorithmic method gives better color matching, and offers four options:

Option	Description
Perceptual	This maintains perceptual differences. Colors are interpreted relative to the destination device's white point. This option is usually best for photographic scanned images.
Colorimetric	This maintains individual colors at the expense of their relative values. It is usually best for spot colors.
Saturation	This maintains the levels of color saturation. It sacrifices contrast to maintain color saturation. It is usually best for computer-generated graphics.
Faster Matching	This offers a good compromise between photographs and computer-generated images, and takes less time.

ColorSync attempts to provide a base level of color matching with the smallest possible memory footprint (about 70K). Some print jobs require higher quality color matching. More sophisticated color management schemes can replace ColorSync's color matching method and hook into ColorSync via the Component Manager. This process lets other color management products integrate into the system software via ColorSync.

ColorSync still translates the image's colors into the device-independent color space. However, ColorSync then calls the substituted color matching method to translate the image into the color space of the destination device.

Color Calibration
The ColorSync Color Management extensions support the calibration systems available from third-party developers (such as SuperMac, Radius, and Raster Ops). You can periodically update the profile to compensate for differences from the standard profile.

Apple Color Printer: Cleaning Nozzles, Printing Test Pages

- **Last Modified:** May 25, 2001
- **Article:** TA28748

- **Old Article:** 11159

This article describes the Menu choices you have when you clean the nozzles and print test pages on the Apple Color Printer.
Here's how to enter the Apple Color Printer's Menu:

Press the On Line button to turn off the green light. You can then move back and forth through the Menu items using the < and > keys. If you press the Enter button while any of these Menu items are displayed, you see the choices you have under that item. You can move back and forth through the choices in the Menu sublevels using the < and > keys. Press the Exit button to move up a level in the menu.

There are two different sets of cleaning choices available at each Menu sublevel, depending on whether the Apple Color Printer is in Normal or Service/Factory Mode.

These are the test print and cleaning choices available at each Menu sublevel in Normal Mode:

TEST PRINT
- TEST PRINT A Bubble jet head check pattern
- TEST PRINT B Bubble jet head/main unit precision check pattern 1

Note: Test Print B is only available after a print job is sent to the printer.

CLEANING
- CLEANING A Same as user CLEANING A
- CLEANING B For checking ink passage pressure at factory

IMPORTANT: The Service/Factory Mode Cleaning D uses large quanties of ink. Only use Cleaning D if the other cleaning methods fail to adequately clean the nozzle.

These are the cleaning choices available at each Menu sublevel in Service/Factory Mode:

- BLACK OFFSET
- CYAN OFFSET
- MAGENTA OFFSET
- YELLOW OFFSET
- DIRECTION OFFSET

TEST PRINT
TEST PRINT A Bubble jet head check pattern
TEST PRINT B Bubble jet head/main unit precision check pattern 1
TEST PRINT C Printing Position check
TEST PRINT D Same as B, but pattern 2
HEAT RUN Printer mechanism check (paper feed and carriage driven without printing)
CENTER HEAD Moves print head to center for removal You turn off the power to exit this mode.

CLEANING
- CLEANING A Same as user CLEANING A
- CLEANING B For checking ink passage pressure at factory
- CLEANING C For filling system with ink
- CLEANING D FLUSHING raises the temperature of the print head, uses 3.5 grams of ink, and takes 4 minutes.

To enter the Service/Factory Mode, follow these steps:

1) Hold both arrow keys down and turn the power on.
2) When you see the first rectangle on the display, release the arrow keys and press the ON LINE key.
3) While holding the ON LINE key down, press the ENTER key twice and release all keys.

You will now be able to access the choices in the Service/Factory Menu.

Cleaning the Nozzles
If streaks or other unpleasant artifacts start appearing in printed documents, cleaning the nozzles may improve printing. The following control panel steps initiate the nozzle cleaning process:

1) Press the On Line button. The green light goes out.
2) Press the Menu button two times in succession to cycle through these displayed modes:

- Printing Mode
- Cleaning

3) Press the Enter button two times in succession to cycle through these displayed modes:

- Cleaning-A
- 08-Cleaning

The cleaning process begins and completes in a few moments. When the cleaning is complete, the display shows Cleaning-A.

4) Press the On Line button. Display shows 00 Ready.

If issues persist after two or three uses of the Cleaning-A process, two other methods provide more thorough cleaning (and use a much larger quantity of ink). You can find more detailed instructions for Cleaning-B and Flushing functions in the "Apple Color Printer User's Guide."

Printing Test Pages
To print the Test Page A, follow these steps:

1) Press the On Line button. The green light goes out.
2) Press the Menu button three times to cycle through these displayed modes:

- Printing Mode
- Cleaning
- Test Print

3) Press the Enter button twice to cycle through these displayed items:

- Test Print-A
- 01-Test Print

The test page is printed. When the nozzle test is complete, the display shows Test Print-A.

4) Press the On Line button. Display shows 00 Ready.

To print Test Page B, follow these steps:
1) Press the On Line button. The green light goes out.
2) Press the Menu button three times to cycle through these displayed items:

- Printing Mode
- Cleaning
- Test Print

3) Press the Enter button. Display shows Test Print-A.

4) Press the Menu button. Display shows Test Print B.

5) Press the Enter button. Display shows 01-Test Print.
- The test page is printed. When the page is printed, the display shows Test Print-B.

6) Press the On Line button. The display shows 00 Ready.

Note: Test Print B is not available until a print job has been sent to the printer.

To print the Nozzle Check page, follow these steps:
1) Press the On Line button. The green light goes out.

2) Press the Menu button three times to cycle through these displayed items:

- Printing Mode
- Cleaning
- Test Print

3) Press the Enter button. Display shows Test Print-A.

4) Press the Menu button twice to cycle through these displayed items:

- Test Print B
- Nozzle Check

5) Press the Enter button. Display shows 01-Test Print.
- The test page is printed. When the nozzle check is complete, the display shows Nozzle Check.

6) Press the On Line button. Display shows 00 Ready.

RAM Speed and CPU Speed: How They're Related

- **Last Modified:** January 12, 1993
- **Article:** TA28757

- **Old Article:** 11171

How are RAM speed and CPU speed related?

RAM and CPU speed are related by cycle time and wait states.

Cycle Time

Cycle time is the minimum time it takes the processor to "turn around," or complete execution of an instruction.

On a 25 MHz CPU, the clock generates 25,000,000 pulses per second. That is to say, each pulse comes every 1/25,000,000 second (or after 25,000,000 pulses, one second has elapsed).

One divided by 25,000,000 means each pulse lasts 40 nanoseconds (4.0 x 10 EE-8). So, if the processor were running at top speed, it could write a value to RAM, change it in one cycle, and rewrite it 40 nanoseconds later. In this system, the RAM would have to be able to respond within 40ns, or 40ns RAM. However, 40ns RAM is hard to make and expensive, so someone had the idea to let the processor go fast for everything else it does, but to slow down accesses to RAM.

Wait State

Thus was born the idea of the wait state, in which the processor spins its wheels for one, two, or more cycles, to give the RAM a chance to catch up. So in our mythical 25 MHz machine described above, one wait state would mean we could use plentiful and cheap 80ns RAM. Two wait states would permit 120ns RAM, and so on.

Some designs are easy, and use a fixed number of wait states -- but not the Macintosh. Depending on what activity is being done and whatever else is going on, the Macintosh can impose a variable number of wait states.

Generally, though, if you use the calculation above with recent designs, you can assume one wait state and get the RAM speed.

(1 divided by clock speed) x 2 = ___ ns)

Wait states are not free, however. While the processor is spinning its wheels, that fast CPU and support hardware you paid for is useless. For this reason, cache RAM, which is very fast, can be used to eliminate or reduce wait states to the processor, and then the cache controller is used to write to slower main RAM. Also, though this refers to writes, the same applies to reads.

Archived - Communications ToolBox: Basic Connectivity Set 1.1.1

This article describes the Communications ToolBox, Basic Connectivity Set 1.1.1 (released on January 4, 1993), which has a new XMODEM Tool and Serial
Tool. The disk image is posted on Apple Support website, Apple Software Updates.
This article has been archived and is no longer updated by Apple.
The Communications ToolBox, Basic Connectivity Set 1.1.1 contains a revised XMODEM Tool with many important bug fixes, and a new Serial Tool. It's readily available to those needing it, as it is posted on the internet.

Users of the XMODEM tool can also contact the manufacturer of their application -- the one that provided the original XMODEM tool -- for an Update.

Officially, Apple has shipped the Communications ToolBox, Basic Connectivity Set with only one retail product -- MacTerminal 3.0 -- and through APDA.

Many third parties, for example Microsoft, Claris, Pacer, and White Pine, have distribution licenses for the software. They are bound by contract to make
the software available to their customers (but not necessarily free of charge).

Installation Instructions

If you received an image file, create an install disk. Then with the Basic Connectivity Set install disk:

- On Macintosh computers running System 7, drag the Communications ToolBox tools from the Basic Connectivity Set disk into the (closed) System Folder. When a dialog box tell you the tools need to be installed in the Extensions folder, click yes.
- On Macintosh computers running System 6, locate the Communications Folder stored in the System Folder. Drag the Communications ToolBox tools from the Basic Connectivity Set disk into this folder.

Bug Fixes and Features

Here are the features of the new software on the disk.

XMODEM Tool 1.1

XMODEM Tool 1.1 has been improved over the XMODEM Tool 1.0.2 in the following ways:

- Improved reliability. The XMODEM Tool 1.1 is less susceptible to protocol violations, line-noise, and corrupted bytes.
- Performance increase of up to 400%.
- In a few cases when transferring files with XMODEM Tool 1.0.2, the tool would not wait correctly for the receiver to acknowledge the successful receipt of a block. XMODEM Tool 1.1 fixes this problem.
- In System 7, support for creating a new folder when saving a downloaded file using Straight XMODEM or XMODEM Text transfers.
- With the XMODEM Tool 1.0.2, a dialog claiming that there wasn't enough disk space to receive a file would appear when receiving with the MacBinary method, IF the actual data received wasn't MacBinary. Now when non-MacBinary data arrives, the transfer switches to Straight XMODEM.

Serial Tool 1.0.2
When using the Serial Port Arbitrator included with AppleTalk Remote Access, a Serial Tool 1.0.1 dialog box would inform the user that the selected serial port was in use, even when no other service was using the port. The only way to override the "busy port" dialog was to hold down the Option key.

The Serial Tool 1.0.2 properly allows the access to the serial port when the Serial Port Arbitrator is installed and the serial port is not in use by another service.

These articles can help you locate the software update mentioned here:

ARCHIVE

Apple IIe Enhancement Kit: Technical Benefits

- **Last Modified:** August 13, 1997
- **Article:** TA28815

- **Old Article:** 1127

This article has been archived and is no longer updated by Apple.
This article documents the benefits of the Apple IIe Enhancement Kit.

```
The Apple IIe Enhancement improves the performance of the Apple IIe by replacing four chips on the main
circuit board.

The Enhancement has four major benefits:

 1. Apple IIc compatibility:

      Users can take advantage of software developed for the Apple IIc.

 2. Product line consistency:

      Apple II software can be used on both the Apple IIe and IIc.

 3. The MouseText character set makes it easy for developers to create
    software that uses pull-down menus, windows, and icons.

 4. Easier programming for users:

      a. Accepts BASIC commands in both upper- and lowercase
      b. Additional instructions in the 65C02
      c. Mini-assembler for machine language programs.

The Apple IIe Enhancement Kit, Order A2M2052, is available from Apple Authorized Dealers for users who wish to
upgrade their systems.

Archived - PowerBook 100: Backup Battery Life

How long do the PowerBook 100's backup batteries last under normal circumstances, when the main battery is not installed?

Products Affected

PowerBook

This article has been archived and is no longer updated by Apple.
This depends on system load, temperature, and the history of the backup battery. Remember, the only purpose of the backup battery is to supply the PowerBook 100 with enough power to preserve the data in memory during the short time it takes to change the main battery. It is not recommended for any other purpose.

Macintosh Operating System: Maximum Volume Size

- **Last Modified:** August 18, 1998
- **Article:** TA28860

- **Old Article:** 11333

We have been seeing some strange results when trying to use volumes larger than 2 GB. What is the maximum volume size supported by the Macintosh operating system?
A set of modifications to the Finder and HFS were implemented to raise the maximum volume size of 2 GB to 4 GB. This was done by treating volume sizes as unsigned values. The exact upper limit is 4063 MB. System 7.5.2 (and newer) increases this limit to 2 terabytes on some computers, including:

- any system that shipped with System 7.5.2 or newer.
- any Macintosh system with PCI slots.

It is not necessary to have SCSI Manager 4.3 installed to take advantage of the larger volume sizes.

Note that AppleShare, including Personal File Sharing, has its own volume size limitations. For more information, please see the following Tech Info Library article:

Article 15460: "**AppleShare File Server: Chart Of All Limitations**"

With versions of the Macintosh operating system previous to System 7.5 we recommend making the volume sizes slightly less than 2 GB to ensure that you do not run into any limitations.

This means that if you have a hard disk drive with a formatted capacity larger than the 2 GB, you must partition it into multiple volumes smaller than 2 GB. We have found that a partition size at least 1 MB smaller than 2 GB seems to work acceptably.

Possible symptoms of volumes equal to, or larger than the 2 GB limit include:

- Negative file sizes
- Inability to copy files because "More space is needed" even though plenty of space is available.
- Similar symptoms on Novell (or other) servers when the volumes published over the network are larger than 2 GB.

This is a hard limitation. There are no workarounds other than partitioning the drive into multiple volumes or updating your computer and any client computers that may log on to the volume to System 7.5.x or newer.

Centris 610 & 650, Quadra 800: Custom ICs

There are three new custom ICs introduced with the Centris 610, Centris 650, and Quadra 800:
* DJMEMC: Dale & Jay's Most Excellent Memory Controller
* IOSB: Input/Output Subsystem Buffer
* KIWI: NuBus Controller

These three ICs integrate functions provided by the ten custom ICs found on the Quadra 700 logic board. This article describes each of these ICs in detail.

The information in this article relative to the Centris 610 and Centris 650 is also relevant to the Quadra 610 and Quadra 650.
Cet article a été archivé et ne sera plus mis à jour par Apple.
Note: The Centris 610, Centris 650, and Quadra 800 also include a number of ICs developed for previous Macintosh models. Although not described in this article, they are:

* DFAC: Sound - Input and File
* MC68040: Microprocessor
* AC843: CLUT/DAC
* Antelope: Low cost CLUT/DAC
* MCCS142235: Active SCSI Terminator
* DP8534: Video timing generator
* SONIC: Ethernet controller
* 53C96: SCSI controller

DJMEMC (Dale and Jay's Most Excellent Memory Controller)

DJMEMC is a very large-scale IC that combines functions performed by multiple devices in previous Macintosh designs. DJMEMC attaches to the system bus and provides the control and timing signals for the RAM, ROM, and VRAM. It also controls the logic that controls the system bus arbitrations that provide the video timing and control signals. In summary, key functions provided by the DJMEMC are:

* Address decode
* Bus arbitrator
* Configuration register
* DRAM/ROM controller

* System bus interface
* Video timing
* VRAM controller

DJMEMC also includes a complete video frame buffer controller for a VRAM-based frame buffer which supports high performance graphics. Essentially, all of the DAFB frame buffer controller used in the Quadra 700, 900, and 950 have been incorporated into DJMEMC. Therefore DJMEMC is capable of supporting all of the display options and configurations supported by the Quadra 700, 900, and 950. This frame buffer also makes use of two new devices: the National DP8534 clock generator, and the Antelope CLUT/DAC. The 8534 (not compatible with the DP8531 used by the earlier Quadra computers) generates all video clock frequencies needed, up to and including 100 MHz. Antelope is a significantly cost-reduced version of the AAC, and does not include support for 24 bpp or Apple convolution. Antelope is pin- and software-compatible with the AAC used by the Quadra 950.

IOSB (I/O Subsystem Buffer)

IOSB performs some of the functionality found in the JDB/Relayer two-chip set used in the Quadra 700, 900, and 950 -- and also integrates a number of the discreet components which were located on the Quadra 700, 900, and 950 I/O bus.

The key functions of the IOSB ASIC are:
* Byte steering
* Bus sizing
* Alternate I/O bus masters
* Device decode logic
* CPU ID register
* Sound
* VIAs
* SWIM2

* Power on circuit
* System watchdog timeout
* Interrupts

Byte Steering: The 68040 does not support data steering. However, the 68030 allows 8-bit and 16-bit slaves to attach to a given byte lane and indicate their port size during cycle acknowledge. Hardware in the 68030 bus interface did the appropriate byte steering. This allows S/W to do byte accesses to consecutive bytes in 8-bit devices like the SCC without any external logic. In order to maintain compatibility with existing software, the IOSB ASIC does byte steering for 68040 accesses to I/O bus peripherals.

Bus Sizing: The 68040 does not support dynamic bus sizing; it expects accesses to 8-bit and 16-bit ports to be of the appropriate size, that is access.B for 8-bit ports and access.W for 16-bit ports. However, the 68030 allows 8-bit and 16-bit slaves to attach to a given byte lane and indicate their port size during cycle acknowledge. The hardware inside the 68030 does the appropriate number and type of bus cycles to fulfill the request. This allows long word accesses to 8-bit devices, like the SCC. To maintain compatibility with existing software, IOSB does dynamic bus sizing for 68040 accesses to I/O bus peripherals.

Alternate I/O Bus Masters: IOSB allows the SONIC Ethernet controller to be a bus master on the System bus. SONIC drives the System bus snoop control bits (SC1 and SC0) directly, while IOSB drives the TT control lines. The status of these bits is determined by a register within SONIC, and should be initially configured not to snoop.

IOSB does not support true burst transfers to the I/O bus. If a System bus master attempts to burst data to or from an I/O bus slave, IOSB will invoke a 68040 fake burst. This allows use of the MOVE16 instruction for I/O bus data. IOSB itself does not initiate burst cycles on the System bus.

Device Decode Logic: IOSB provides device selects according to the memory maps shown earlier. It provides chip select for all I/O bus devices (that is, Ethernet PROM, patch ROM, SCC, SCSI, and SONIC) and internal IOSB cells (that is, VIAs, SWIM2, sound, and ADB). Note that DJMEMC and KIWI provide their own chip selects.

Sound: IOSB provides a variation of the sound controller used in the Sonora ASIC (used on the Macintosh LC III). However, instead of using DRAM or VRAM for sound I/O buffers, IOSB will internally provide 3K of internal static RAM.

Separate 1-Kbyte buffers are provided for left sound output, right sound output, and mono sound input. Since a sound output buffer is not reused for sound input, IOSB will be capable of providing simultaneous stereo sound output while recording from the sound input port. Sound buffers internal to IOSB are required for maximum software compatibility with Apple and third-party sound drivers.

VIAS:IOSB includes two VIAs, similar to the original Macintosh II. The VIA clock is generated within IOSB. VIA1 is the same VIA cell used in VISA, V8, Sonora, and PSC. It has full Macintosh VIA capabilities. VIA2 is a variation of the cell used in VISA, V8, etc.... This is not a complete VIA, but performs all the functions required from VIA2 (mostly interrupt support and some read/write port bits).

SWIM2:IOSB contains the SWIM2 floppy disk controller. It has full Macintosh SWIM2 capabilities, and is capable of supporting a 2.88MB floppy format.

Power-On Circuit: The Centris 610, Centris 650, and Quadra 800 use the same power-on logic as the Macintosh IIci. However, the portions of the power-on circuitry that do not run off the +5V trickle supply have been moved into the IOSB ASIC to reduce component count on the motherboard.

System Watchdog Timeout: IOSB includes timeout logic that monitors system bus activity and terminates faulty cycles with a bus error indication. This timer does not run when an access is made to a NuBus device; it assumes that the NuBus controller will include a timer which handles the (longer) NuBus timeout period (25.6 ?sec).

IOSB also maintains a watchdog timer for the entire system, including NuBus. This timeout has a longer period than previous timers, and prevents "hanging" while waiting for a response from a damaged or non-existent device. For instance, this timer would catch PDS cards that do not respond to all accesses to NuBus slot E space (see YANCC description for more information on PDS decoding).

Interrupts: IOSB will terminate all 68040 interrupt acknowledge cycles with autovector indication. Like the Quadra 700, 900, and 950, the Centris 610, Centris 650, and Quadra 800 allow separate mappings for different operating systems.

IOSB also provides for multiple modes of operation to support the use of IOSB in future CPUs, and to provide a failsafe mechanism in case of problems during development. These options include:

* Internal/external sound (allows use of the EADSC for higher quality sound output)
* Internal/external SWIM

KIWI

The KIWI ASIC provides the interface between the System bus and NuBus. It combines the functions that were provided by the YANCC ASIC, two bus transceivers, and several discrete driver chips. KIWI provides a complete 68040 bus interface on one side and a complete NuBus interface on the other.

Key functions provided by the KIWI ASIC are:
* Support for all types of single transfers
* One longword deep buffer
* Support for block move transfers for NuBus masters accessing memory on the motherboard
* Pseudo-block transfers from the 68040 to NuBus slaves
* Several of the new functions being defined by NuBus 90 spec

DAL: Informix and LIKE Function SQL Queries

- **Last Modified:** October 04, 2008
- **Article:** TA28886

- **Old Article:** 11364

This article has been archived and is no longer updated by Apple.

I am running DAL on a Sun server, using the Pacer technology. I am trying to query the database, but I'm having difficulty translating the SQL queries for an Informix database into a DAL-compatible SQL query.

The query is:

SELECT <whatever> from <table> where acctkey[4,6]="680"

For example - check the 3 characters in the acct code from position 4 to 6 and see if they match 680. How would I do this in DAL?
The way to do this query in DAL is the same as the DB2 ANSI-standard query using the LIKE function. DAL follows the ANSI-standard, and when there is no standard defined it follows DB2's format.

For this query the LIKE function is the appropriate command. The LIKE function allows you to substitute either:

* An underscore character ("_") for EACH position in which you will accept any character before your desired string

* A single percent sign ("%") for a string of ANY LENGTH that you will accept before and/or after your desired string

In the case of your example (We spaced between the underscore characters to make the point about the number of positions before your desired character string compare):

select <whatever> from <table> where acctkey like '_ _ _ 680%';

This means: select when the value of positions 4, 5 & 6 of the account key = 680, and I don't care what follows position 6. In reality the command would look like:

select <whatever> from <table> where acctkey like '___680%';

If you wanted to search for "680" in any position the command would be:

select <whatever> from <table> where acctkey like '%680%';

DAL will translate this "standard format" query into the appropriate format for the individual DBMS. So this should work for Informix since it supports the positioned query (where acctkey[4,6] ="680").

We don't have access to an Informix database at this time, so we can't verify it against Informix, but we feel confident that the LIKE function will be translated properly. We did test with both Sybase and Rdb and it worked fine.

Be aware that you should put the "%" behind the desired compare string in the LIKE clause unless you are searching for the last positions in the field. If the compare doesn't work for you without the "%", add it and try the SQL statement again.

Centris 610, 650 & 660AV: Differences

What are the major differences between the Macintosh Centris 610, the Centris 650 and the Centris 660AV?

The information in this article relative to the Centris 610 and Centris 650 is also relevant to the Quadra 610 and Quadra 650.
This article has been archived and is no longer updated by Apple.

The major differences between the Centris models are:

Feature:	Centris 610:	Centris 650:	Centris 660AV:
Processor	MC68040 @20 MHz	MC68040 @25 MHz	MC68040 @25 MHz
DRAM Expansion	4 MB to 68 MB	4 MB to 132 MB	8 MB to 68 MB
DRAM Slots	2 slots	4 slots	2 slots
DRAM Speed	80 ns(nanoseconds)	80 ns	70 ns
DRAM SIMM Sizes#	4,8,16 & 32 MB	4,8,16 & 32 MB	4,8,16 & 32 MB
DRAM SIMM Type	72-pin	72-pin	72-pin
Ethernet	Optional	Optional	Standard
FPU	None	Optional	Standard
ROM Size	1 MB	1 MB	2 MB
Maximum VRAM	1 MB (512K stnd)	1 MB (512K stnd)	1 MB (I MB stnd)
VRAM Slots	1 slot	1 slot	1 slot
VRAM Speed	80 ns(nanoseconds)	80 ns	80 ns
NuBus Slots	1!	3	1*
PDS Slot%	Yes	Yes	Yes

Notes:
Composite SIMMs are not supported.
! With optional Centris 610 NuBus Adapter Card installed.
* With optional Centris 660AV NuBus Adapter Card installed.
% On the Centris 610 and 660AV models, the PDS Slot is the Expansion
Slot - it can either be used as PDS slot or as a NuBus slot with the appropriate NuBus Adapter Card installed.

The Macintosh Centris 610 and 660AV share the same type of enclosure (form factor) which is a flat, rectangular "pizza" box. The Macintosh Centris 650 uses a Macintosh IIvx style desktop box.

Additionally, the Macintosh Centris 660AV boasts a number of additional features not found in the Centris 610 & 650 including:

* An on-board DSP (Digital Signal Processor) Chip
* GeoPort Communications Architecture
* Composite and S-Video input and output ports
* Sound input and output ports

Last Modified: Feb 19, 2012

Additional Product Support Information

Centris 610 and 650: Floating-Point Unit Upgrades

The Macintosh Centris 610 and the Centris 650 4/80 configuration come with an FPU. Can I upgrade these Centris models with an FPU? Are there any compatibility problems if my Centris doesn't have an FPU?

Some configurations of the Quadra 650 have an FPU standard, those that do not can be upgraded as per below. The Quadra 610 is the same as the Centris 610.
This article has been archived and is no longer updated by Apple.

FPU Upgrades

You can upgrade the Macintosh Centris 610 or 650 with an FPU, but Apple doesn't provide or support such an upgrade. You must rely on third-party companies who can remove the 68LC040 from its socket and replace it with a 68RC040. Since Apple doesn't intend to offer an upgrade, we can't guarantee that the processor will remain a socketed component.

Compatibility without an FPU

There aren't very many compatibility problems with non-FPU systems. While the addition of an FPU allows certain types of applications to execute faster, these applications tend to be more technical in nature. Business applications -- such as spreadsheets, databases and word processors -- don't require an FPU to run.

Most applications check to see if there's an FPU present. If one doesn't exist, they emulate the floating point instructions in software. There are a few applications that expect or require an FPU. These applications will present problems and we anticipate most software developers will revise these products.

Macintosh: Pre-System 7.x Font Sizes

I am using System 6.0.x and noticed that some of my fonts are now showing a different memory size. Why?
This article has been archived and is no longer updated by Apple.
When using the Font D/A Mover, you may notice that some fonts show a different memory size, depending on what version of system file you are accessing. The fonts distributed by Apple have not actually changed in size; rather, a FOND resource was added to the System file with the introduction of the LaserWriter Plus. When the Font D/A Mover calculates the size of a font in bytes, the FOND resource for that font is also included. If you need to know a font's actual size, use ResEdit and do a Get Info for the font.

Notes:
1. ResEdit is a resource editor by Apple Computer, Inc. It allows you to make modifications to files. This application is a developer tool and Apple Computer does not provide support for ResEdit or applications modified using ResEdit.

2. Font D/A Mover is only required with versions of the Mac OS prior to System 7.x.

Color Classic, LC 520: Power Switches

- **Last Modified:** November 09, 1999
- **Article:** TA28915

- **Old Article:** 11447

This article has been archived and is no longer updated by Apple.
I just pulled my new Color Classic out of the box, plugged it in, and turned it on but it didn't power up.

Also, can I shut off the dialog box that comes up once I hit the Power key on the keyboard?

When the Color Classic and the LC 520 first come out of the box and the power switch on the rear is turned on, the computer doesn't start up. To turn on the computer, just press the power key on the keyboard. Most power-on and -off operations should be done from the keyboard.

You need to use the power switch in the back of the Color Classic and the LC 520 only to prepare them for:

- Long-term storage
- Removal of the logic board. (If you forget to turn this switch off before removing the logic board, there is a danger of shorting something out, because power will still be active on the board.)

To shut down the Color Classic or the LC 520, press the power key on the keyboard.

For data security reasons, we thought it was best that the dialog appear each time the keyboard button is pressed. The dialog box cannot be disabled.

Archived - Macintosh LC III: Using with a VGA Monitor

This article describes how to connect a VGA monitor to a Macintosh LC III.
This article has been archived and is no longer updated by Apple.
To connect a VGA monitor to the Macintosh LC III video port, a cable with the following configuration is required.

```
Macintosh LC III
DB-15                                       VGA Connector
-------------                               --------------

 2  ------------------- Red Video ------------  1
 1  ------------------- Red Ground -----------  6
 9  ------------------- Blue Video -----------  3
13  ------------------- Blue Ground ----------  8
 5  ------------------- Green Video ----------  2
 6  ------------------- Green Ground ---------  7
15  ------------------- Hsync ---------------- 13
12  ------------------- Vsync ---------------- 14
14  ------------------- Sync Ground ---------- 10
10  ---------------- |
 7  ---------------- |Connect 7 & 10 so the sense pin ID will equal VGA
```

A few issues to remember when connecting VGA monitors to the Macintosh LC III:

* VGA monitors may have variances when purchased from different VGA monitor vendors. Test a particular monitor for compatibility with the Macintosh LC III before buying.

* VGA monitors from different vendors have different image quality specifications. There may be significant differences between Apple-brand monitors and VGA monitors. Look at the monitors side-by-side before buying.

* When a VGA monitor is connected as described above, the resolution is 640 x 480.

* The bit depth supported depends on the amount of VRAM installed. The Macintosh LC III ships with 512K of VRAM in one VRAM SIMM socket and is expandable to 768K.

System Enablers: Current Versions & Change History

- **Last Modified:** October 20, 2000
- **Article:** TA28948

- **Old Article:** 11491

This article has been archived and is no longer updated by Apple.
This article lists the current versions and the change history of the Macintosh system enablers.
In the past, when Apple released new computers, the system software was revised. To get around this problem, system enablers were written which contained information necessary for newer computers to start up. All Apple computers released since system software 7.1 (September 1992) require a system enabler to start up.

A universal enabler was developed that supports all computers released before System 7.5. This enabler shipped with System 7.5.

Computers listed in this article do not require an enabler if they use system software versions 7.5.3 and later.

Current Macintosh system enablers

Note: The Plus, SE, SE/30, Classic, Classic II, LC, LC II, LC 580, Mac II, IIx, IIcx, IIsi, IIci, IIfx, PB 100/140/145/170, Quadra 700, 900, and 950 do NOT need a System Enabler. Also, the Performa 200, 400, 405, 430, and 410 do NOT require a system enabler.

CPU	Enabler	Current Version	Note
Centris 610	System Enabler 040	1.1	D
Centris 650	System Enabler 040	1.1	D

Notes:

A - System Enabler 131 replaces System Enabler 111 and System Enabler 121.

B - Express Modem users should also install the Duo Battery Patch (extension).

C - Requires System Software 7.1.1 or later. System Software 7.1.1 and PowerBook Duo Enabler 2.0 ship with the PowerBook Duo 280 and 280c.

D - No system enabler is required for this Macintosh under System 7.5 or later.

E - Power Macintosh 6100/66, 7100/80, 8100/100, and 8100/110 require System 7.5 and Finder 7.5.1 or later.

F - Requires System Software 7.5.2 or later.

G - No system enabler is required for this Macintosh under System 7.5.3 or later.

H - No system enabler is required for this Macintosh under System 7.5.5 or later.

I - These computers shipped with 7.5.5 and require the enabler with it. These do not support Mac OS 7.6. They do support Mac OS 7.6.1.

J - The Power Macintosh 4400/200 shipped with 7.5.3 and requires the enabler with it. It does not support Mac OS 7.6. They do support Mac OS 7.6.1.

K - These Power Macintosh shipped with 7.6.1 and do not require an enabler. They do not support Sys 7.6 or earlier but will support Mac OS 8.

L- The Performa 600 requires System Enabler 304 to run Performa System Software (7.1Px) and Macintosh System Enabler 001 to run Macintosh System Software (7.1).

Enabler Change History

PowerBook 150 Enabler
1.1 - First release.

PowerBook 500 Series Enabler
1.0.2 - First release.

PowerBook 5300/2300/190 Enabler
1.0.2 - First release.

1.0.8 - Added support for NiMH batteries.

1.1 - Reference release for 5300 and 190 builds.

1.2 - Reference release for 2300 builds.

1.2.1 - Fixed several issues on PowerBook 5300/2300/190 computers.

1.2.4 - System software enhancements improving reliability and performance

PowerBook Duo Enabler
1.0 - First release. Replaced System Enabler 201.

2.0 - Includes support for type III batteries, better support for dual monitors, and multiple resolution support for color displays. Added support for PowerBook Duo 280 and 280c.

Note: No longer available from Apple Software Updates.

PowerPC Enabler
1.0 - First release.

1.0.1 - Fixes some video and serial communications problems.

1.0.2 - Improved Energy Star compatibility for certain monitors connected to the built-in video port.

1.1 - Manufacturing release only.

1.1.1 - Added support for speed bumped Power Macintosh. Requires Finder 7.1.5.

PowerPC Upgrade Card Enabler
1.0 - First release.

1.0.1 - Includes Communications Toolbox 1.1

System Enabler 001
1.0 - First release.

1.0.1 - Improved support for high speed serial communications and improved accuracy of the system clock. Also addressed a rare problem where floppies may not be ejected properly at shutdown.

System Enabler 003
1.0 - First release.

1.1 - Updated in System Update 3.0. Minor bug fix for compatibility.

System Enabler 040
1.0 - First release.

1.1 - Added support for Quadra 610 and Quadra 650.

System Enabler 065
1.0 - First release for Macintosh LC 475 and Macintosh Quadra 605.

1.1 - Added support for Macintosh LC 575.

1.2 - Minor bug fix for compatibility.

System Enabler 088
1.0 - First release.

1.0.1 - Required for System 7 Pro 7.1.1 support.

1.1 - Added support for Quadra 660AV.

1.2 - Corrects problems with serial port, involving printing to LaserWriter 310 Select and crashing in certain instances when receiving a fax while network traffic is high.

System Enabler 131
1.0 - First release to support the PowerBook 180c. Replaced System Enabler 121 (supporting 165c) as well as System Enabler 111 (supporting 160 & 180).

1.0.2 - Corrected a problem involving the serial driver. If a user has the serial driver open, but is not transmitting, and then puts the PowerBook to sleep, any attempt to transmit on waking would cause the system to hang.

1.0.3 - Added support for the PowerBook 165.

System Enabler 401
1.0.4 - First release.

1.0.5 - Fixed a problem involving erratic mouse movement with Apple II mouse-based applications running on the Apple IIe card installed in the PDS.

System Enabler 403
1.0 - First release for Macintosh LC 520.

1.0.1 - Manufacturing release only.

1.0.2 - Added support for Macintosh LC 550.

System Enabler 404
1.0 - First release.

System Enabler 405
1.0 - First release.

System Enabler 406
1.0 - First release.

System Enabler 701
1.0 - First release for Power Macintosh 9500; requires System Software 7.5.2.

1.1 - New enabler for Power Macintosh 9500 and Power Macintosh 7200 only; requires System Software 7.5.2.

1.2 - New enabler for Power Macintosh 7500 and Power Macintosh 8500 only; requires System Software 7.5.2.

Where to find system enablers

Macintosh PC Exchange: Manual Correction (2/93)

- **Last Modified:** February 16, 1993
- **Article:** TA28984

- **Old Article:** 11544

Page 14 of the Macintosh PC Exchange manual states that you can create a mapping for a DOS file with "no suffix". However, if you try to do this, you get the message "To complete the assignment, the DOS suffix must be specified". Is the manual incorrect?

The Macintosh PC Exchange manual is incorrect: it is not possible to create a mapping for a DOS file without the three-character extension, referred to in the Macintosh PC Exchange manual as a "suffix".

Archived - Font Pack: Some Fonts Give Double Image in Bold (2/93)

Some fonts in the Apple Font Pack print out a double image when in the bold style. The fonts we've seen with this problem don't have an explicit "bold" version. Two examples we have verified are Onyx and Oxford. The double exposure is easier to see at larger point sizes.

The workaround is not to use bold styles for these fonts, since there isn't a bold version defined for them.

This article has been archived and is no longer updated by Apple.
When font developers consider creating a separate glyph set for bold and italic, they base their decision on aesthetics. If a particular font (for example, Symbol, Oynx, Oxford, Chicago...) doesn't look pleasing to the eye when in bold or italics, the developer doesn't create a separate TrueType font face.

When there's no collection of glyphs in a particular typeface and style, QuickDraw must add any additional stylistic variations needed. The default bolding function works very well on many fonts. However, this function doesn't produce an aesthetically pleasing look (that is, the edges aren't mitered) on ornate fonts. The look is very apparent when the text is produced at larger sizes or when sent to high resolution raster output devices.

Because Apple doesn't want to limit the user's choices, the user isn't prevented from using the bold style by a grayed out menu selection. Therefore, the user can decide whether the look of the bold font is appropriate.

System 7, Mac OS 8: Limitations of the Finder

- **Last Modified:** May 05, 2000
- **Article:** TA29003

- **Old Article:** 11574

This article gives the limitations of the Finder in System 7 and Mac OS 8.

Finder Limits

- Number of open files: 346
- Number of Apple Menu Items: 52 (More items can added, but only 52 appear in the Apple Menu.)
- Number of files supported by the Desktop: Unlimited (limited to the available disk space -- see Mac OS Standard format limit)
- Number of applications in memory: The Finder does not limit applications, but available RAM does
- Number of volumes available on the Desktop: 32
- Number of items in a folder by list view: Up to 32 000 depending on the computer and RAM. (See the note at the bottom of this article.)
- Number of resources in the System File: 32 767 or 16 MB
- Number of System Extensions or Control Panels that can be loaded into memory: The Finder does not limit these, but hard disk space and RAM can limit them
- RAM allocated to an application with Finder = 999 999 K
- The Finder supports 24-bit color, but icons are only 8-bit
- QuickDraw supports 48-bit color, but the current operating system maximum is 32-bit color
- Disk cache: 32 KB per megabyte of installed RAM

Mac OS Standard Format Limits

- 64K items or 65 536 items per volume
- The maximum length of a pathname under the Finder--including the Volume and Folder--is 255 characters, including colons

For example: InternalHD:Folder1:Folder2:Filename = 35 characters

"Inside Macintosh, Volume IV" states that there is no limit to levels of subdirectories. Because of pathname limitations, it is not always possible to specify a file using its full pathname.

This limitation has nothing to do with the Finder; it is a limitation of the file system.

Note: With System 7.x, attempting to view many files in one window, something between 500 to 1500 files, creates very slow opening times and dropout viewing issues. The specific number depends on RAM and computer. With Mac OS 8.x, it is possible to view as many as 32 766 files, though it is dependent upon RAM available, and performance is significantly degraded.

Archived - ABS Tech Note: DAL17 INGRES Locking Issues

This technical note describes special locking considerations when using DAL with INGRES.
This article has been archived and is no longer updated by Apple.
By default, INGRES provides "repeatable read" transactions. This means that during a single transaction, your application can repeat a DAL query two or more times and is guaranteed that the query results will be identical. Thus, no database changes made by other users during your transactions will be visible to your program. INGRES provides this high level of transaction integrity by locking the sections of the database that your query has accessed until your transaction ends with a COMMIT or ROLLBACK statement. During your transaction, no other user may update the locked portions of the database.

This default INGRES locking can reduce the amount of concurrent access to an INGRES database, especially when a transaction includes "think time" during which your program is waiting for user input. To increase concurrency, INGRES provides several locking parameters which can be set programmatically through the INGRES SET LOCKMODE statement. These excerpts from the INGRES SQL reference manual, pages 2-56 and 2-57, describe these parameters.

Description of lock modes:

SET LOCKMODE provides four different parameters to govern the nature of locking in an INGRES session:

```
* Level: This refers to the level of granularity desired when the table is accessed. You can specify any of
the following locking levels:

   page       Specifies locking at the level of the data page (subject to
              escalation criteria; see below)
   table      Specifies table-level locking in the database
   session    Specifies the current default for your INGRES session
   system     Specifies that INGRES will start with page-level locking,
              unless it estimates that more than Maxlocks pages will be
              referenced, in which case table-level locking will be used.
```

* Readlock: This refers to locking in situations where table access is required for reading data only (as opposed to updating data). You can specify any of the following Readlock modes:

```
nolock     Specifies no locking when reading data
   shared     Specifies the default mode of locking when reading data
   exclusive  Specifies exclusive locking when reading data (useful in
              "select-for-update" processing within a multi-statement
              transaction)
   system     Specifies the general Readlock default for the INGRES system
```

* Maxlocks: This refers to an escalation factor, or number of locks on data pages, at which locking escalates from page-level to table-level. The number of locks available to you is dependent upon your system
configuration. You can specify the following Maxlocks escalation factors:

```
n          A specific (integer) number of page locks to allow before
              escalating to table-level locking. The default "n" is 10,
              and "n" must be greater than 0.
   session    Specifies the current Maxlocks default for your INGRES
              session
   system     Specifies the general Maxlocks default for the INGRES system
```

Note: If you specify page-level locking, and the number of locks granted during a query exceeds the system-wide lock limit, or if the operating system's locking resources are depleted, locking escalates to table-level. This escalation occurs automatically and is independent of the user.

* Timeout: This refers to a time limit, expressed in seconds, for which a lock request should remain pending. If INGRES cannot grant the lock request within the specified time, then the query that requested the lock aborts. You can specify the following timeout characteristics:

```
n          A specific (integer) number of seconds to wait for a lock
              (setting "n" to 0 requires INGRES to wait indefinitely for
              the lock)
   session    Specifies the current timeout default for your INGRES
              session (which is also the INGRES default)
   system     Specifies the general timeout default for the INGRES system
```

Against the backdrop of these SET LOCKMODE parameters and options are the INGRES system defaults for each of the parameters:

Level dynamically determined by INGRES
Readlock shared
Maxlocks 10
Timeout 0 (no timeout)

If you select the system option for any of the SET LOCKMODE parameters, the values above are automatically supplied. When you begin your INGRES session, the INGRES system defaults are in effect. If you override them with other values using the SET LOCKMODE command, you can revert to the system defaults easily.

Similarly, if you set session parameters (such as locking behavior for all user tables accessed by queries in your INGRES session), you can further set parameters for individual tables on an ad hoc basis. After setting the ad hoc locking behavior, you can return it to either the session defaults or to the INGRES system defaults.

INGRES tries to place a lock on every page it touches in a transaction. Depending on the Lockmode, this will lead to an exclusive, shared, or no lock condition on the page. INGRES also escalates locks (as with more than "Maxlocks," the whole table will be locked to prevent deadlocks). The default Lockmode in INGRES is shared. This means that several users can share the same page for "selects," but updates or inserts cannot take place until the page is held only by the updating user. If a user performs a "select * from xxx" type of query, then every physical page in the table is marked and the locks are not removed until the transaction is finished. This prevents other users from making updates to the same table. Concurrency will therefore be reduced.

However, concurrency is only an issue when there are write operations performed on the database on-line (as with updates or inserts). If no updates are going to take place in your application, you should use the "nolock" mode.

If you know in advance that your application will not be updating data in a transaction, it can use the "nolock" mode to eliminate the need for INGRES to lock parts of the database accessed by a query. Here is an example of a DAL sequence that uses this technique:

```
/* Open INGRES for "select" and non-updating operations only: */
 open INGRES dbms;
 open INGRES database "cl1demo";
 execute in INGRES "set lockmode session where readlock = nolock";
 select * from offices;
 [continue with session]
```

If you do not want to turn off locking, you can still improve concurrency in a query-only application by making sure that a COMMIT statement is executed as soon as you have finished processing each set of query results. Do not perform two or more queries in sequence without an intervening COMMIT statement unless your application absolutely depends on there being no changes to the database between the queries.

Finally, if your application must update the database, it should avoid "think" periods during a transaction that locks the database whenever possible. For example, this statement sequence will work correctly when the lockmode is shared or exclusive, but may lock large parts of the database during the "think time:"

```
select (my_columns) where bool_expr;
 /* think and make changes */
 update (my_columns) where bool_expr;
 commit;
```

An alternative approach that will improve concurrency is:

```
/* Do the query the first time without locking */
 execute in INGRES "set lockmode session where level = system,
         readlock = nolock";
 select (my_columns) where bool_expr;
 printall;
 /* application puts data in buffer #1 */
 /* think and make changes and store updates in a buffer #3 */

 /* Turn on locking and do the query a second time */
 execute in INGRES "set lockmode session where level = page,
         readlock = exclusive";
 select (my_columns) where unique_id;
 printall;
 /* application puts data in buffer #2 */
```

```
/* If data remains unchanged from first query, do the update */
if buffer2 == buffer1 {
    update (my_columns)  where unique_id;    /* using contents of buffer
#3 */
   commit;
}
else
{
    /* warn the user that the data has changed since last select */
}

/* Turn locking back off again */
execute in INGRES "set lockmode session where level = system, readlock =
nolock";
```

The "unique_id" can be, for example, the employee number or another identifier that uniquely identifies the rows to be updated. The objective in an update process is to "touch" as few pages as possible, since all touched pages will be locked until the transaction commits. The reason for going through this lengthy process is to avoid having a page locked up for a long time.

ABS Tech Note: DAL25 DB2 and Secondary AUTHIDs

This Tech Note explains what actions are necessary to implement DAL using secondary AUTHIDs, a facility of DB2. Secondary AUTHIDs are utilized in conjunction with a system resource security package (for example, RACF) to simplify access to tables under DB2.

This article has been archived and is no longer updated by Apple.
Information on DB2 modifications necessary to support secondary AUTHIDs should be obtained from the relevant IBM publications. Similarly, more information on security procedures and strategies (such as GROUP definitions with RACF) can be found in the related IBM or third-party publications.

Why secondary AUTHIDs might be used
Secondary AUTHIDs are generally implemented in large IS environments where there are many users that require access to multiple tables in DB2. Although a GRANT could be done for each user/table combination, it is easier to assign users to different groups within the security software and then GRANT table access to the groups, as opposed to the users. For example, there might be fifteen users who all work in the accounting department that require identical access to a DB2 table. All fifteen users can be 'connected' to a group named 'ACTG' within RACF and then the necessary access can be GRANTed (using SPUFI or other DB2 utilities) to 'ACTG'. This way, if more people are added to the accounting department, they only have to be 'connected' to the group within RACF; no other GRANT would be necessary.

How DAL implements secondary AUTHIDs
Since DAL is not used for GRANTing access to tables or performing any system security functions, it can only take advantage of those accesses that are already in place. To do so, the database open must be performed with the 'as user <username>' option. This should be done right after opening the DBMS. An example is shown on the next page.

The DBMS and database are opened without usage of secondary AUTHIDs. The USERID that was utilized to logon to the DAL MVS/VTAM Server is 'RJOHNSO'.

```
DAL> open DB2 DBMS;
DAL> open database 'DB2T' ;
```

A selection is performed against a nonexistent table. The error generated indicates that the USERID was prepended to the query.

```
DAL> select * from foo;
****Remote DAL Error****
*Error:
undefined table name in database (-10204) table not found in database
"network", line 1 :
DSNT408I SQLCODE = -204, ERROR: RJOHNSO.FOO IS AN UNDEFINED NAME
DSNT415I SQLERRP = DSNXOCA SQL PROCEDURE DETECTING ERROR
DSNT416I SQLERRD = 500 0 0 1 0 0 SQL DIAGNOSTIC INFORMATION
```

The database is closed and reopened using a secondary AUTHID that either does not exist or of which 'RJOHNSO' is not a member.

```
DAL> close database;
DAL> open database 'DB2T' as user 'DALPROD' ;
****Remote DAL Error****
*Error:
database not opened (-923) DB2T
"network", line 1 :
DSNT408I SQLCODE = -553, ERROR: DALPROD SPECIFIED IS NOT ONE OF THE
VALID AUTHORIZATION IDS
DSNT415I SQLERRP = DSNXRST SQL PROCEDURE DETECTING ERROR
```

The database is now opened using a valid secondary AUTHID, and a selection is again performed against a nonexistent table. This time, however, the error message indicates that the secondary AUTHID is now prepended to all queries.

```
DAL> open database 'DB2T' as user 'DALTEST' ;
DAL> select * from foo;
****Remote DAL Error****
*Error: undefined table name in database (-10204) table not found in
database
"network", line 1 :
DSNT408I SQLCODE = -204, ERROR: DALTEST.FOO IS AN UNDEFINED NAME
DSNT415I SQLERRP = DSNXOCA SQL PROCEDURE DETECTING ERROR
```

DSNT416I SQLERRD = 500 0 0 1 0 0 SQL DIAGNOSTIC INFORMATION

If the table 'DALTEST.FOO' actually existed, a query would have been performed against it even though the USERID that logged on to the server is 'RJOHNSO'.

Verifying DB2 service levels
If V2.2.0 of DB2 is being used, it is important to verify the application of a PTF from IBM. This PTF, number UN23430, is specifically related to the use of secondary AUTHIDs with DB2. Contact your authorized IBM service representative for more information.

Apple Server Family					
Model	**On Board**	**VRAM Slots**	**Max VRAM**	**RAM Speed**	**DIMM Size**
7250/120 (8)	1 MB	3	4 MB	70ns	1 MB
8550/132 (8)	2 MB (9)	4	4 MB	70ns	1 MB

Notes

1. VRAM soldered on the logic board.
2. Removable SIMM. No VRAM soldered on the logic board.
3. You can install 512K VRAM SIMM, but only an additional 256K of VRAM is recognized.
4. Uses DRAM instead of VRAM. The amount of DRAM is not expandable.
5. The IIci and IIsi use the 1 MB of DRAM installed in the computer. On the IIci, this is the bank A.
6. VRAM SIMMs in the Quadra 700, Quadra 900, and Quadra 950 must be installed in pairs of two SIMMs.

7. Power Macintosh models use DRAM based video for the built-in video, they are only expandable with the VRAM Expansion Card installed. All SIMM slots must be filled on the VRAM expansion card. The Power Macintosh 6100/60 is not expandable. The AV card in the AV versions of the Power Macintosh computers have 2 MB of VRAM and are not expandable.
8. The 7200, 7300, 7500, 7600, 8500, 8600, and 9500 use VRAM DIMMs instead of the customary SIMMS in older Macintosh computers.
9. "On Board" in context of the PCI-based Power Macintosh computers indicates that 1 or more VRAM slots are taken up with DIMMS when they leave the factory: thus, the 7200 has 3 available VRAM slots, while the 7300, 7500, 7600, 8500, and 8600 each have two available to reach the 4 MB VRAM maximum.
10. All DIMMs for these computers are manufactured with identical specs; so this is not a relevant statistic.
11. For the Power Macintosh 9500 computers with the onboard video you can purchase a separate 2 MB Upgrade Kit that installs onto the card itself.
12. Since Power Macintosh 9500 computers without video cards require third-party PCI video support, the VRAM requirements and capabilities vary by manufacturers.
13. The Power Macintosh 4400 series includes 2 MB of EDO memory for video memory, but it supports configurations up to 2 MB 5 V EDO memory or 1, 2, or 4 MB of 3.3 V SDRAM or 3.3 V SGRAM.
14. The Power Macintosh 5500 and 6500 series computers include 2 MB of SGRAM, which is NOT expandable.
15. The video card included with the Power Macintosh 9600 series computers includes 4 MB of video memory, which is not expandable.
16. The VRAM banks must be populated in order. If there is a VRAM upgrade, the SIMM slots should be populated from the back of the CPU to the front.

Additional Product Support Information

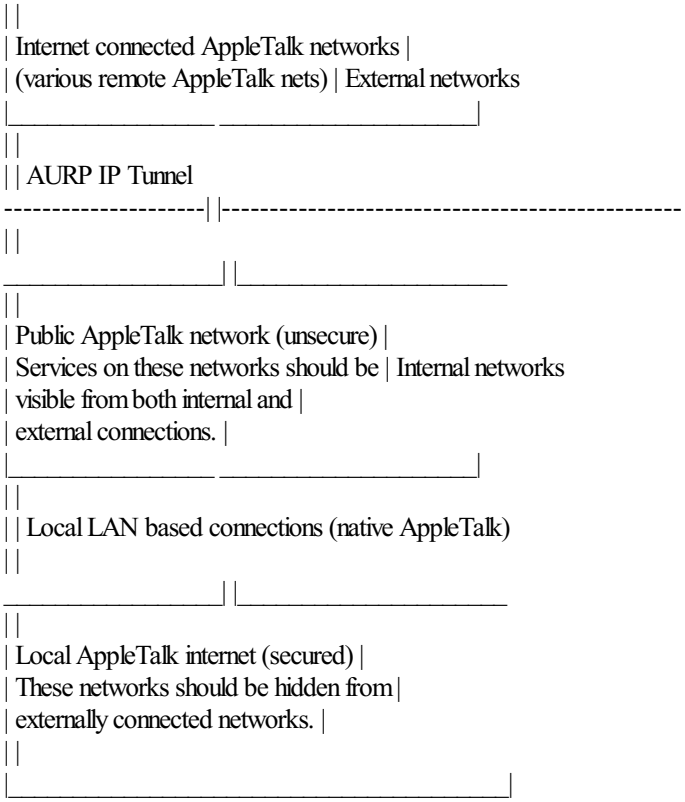
Archived - Apple Internet Router 3.0, IP Extension, & Public Zone (3/93)

I want to allow remote and local AppleTalk networks to connect to a "public network". I want the "clients" attaching to this public network to see the services on that public network only and to have no knowledge of the peer networks attached to the public network. I may not have control of those who wish to connect to my network, so I need a method to manage the "filtering" of the inbound and outbound AppleTalk traffic.

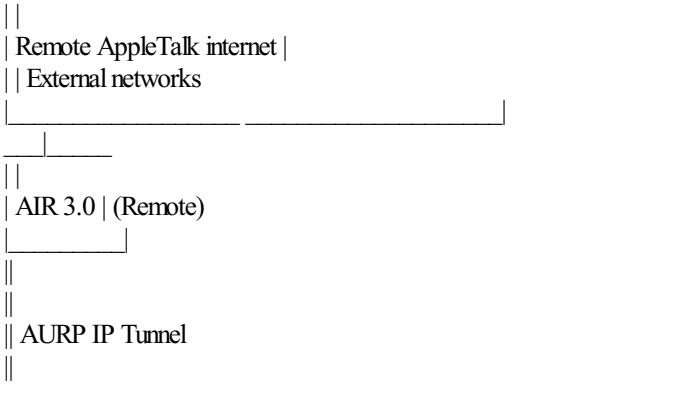
How can I set this service up using AIR 3.0 with the IP extension?

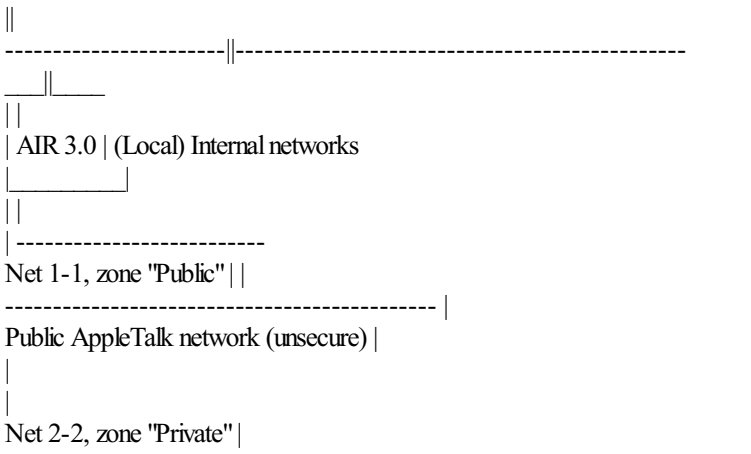
This article has been archived and is no longer updated by Apple.
The information provided below will give you with the type of functionality you're looking for.

First, the following diagrams.



The first diagram lays out the basic design of the network; more detail is added below to show a more workable solution.





The Local Apple Internet Router

Given this configuration, you would follow these steps to configure the routers:

1) In the port info box for the IP tunneling port, deselect "Use only host ID's listed. This would allow any remote site to connect to this router to establish an AURP tunnel.

2) Select "Allow more than 15 hops". This takes care of any problems associated with remote networks that are more than 15 hops away from the public network.

3) Select "Remap remote network numbers". This will allow remote networks which use the same network number as the public network to establish an AURP connection. Chose a range of networks large enough to satisfy the expected number of remote networks you'll have to remap. This will vary from situation to situation, but with a possible range 65,279 - (local network numbers used) you should be able to spare a few thousand numbers for remote remapping purposes.

4) Select "Cluster remapped networks". This is optional and only necessary if you are concerned about the size of the routing table or RTMP packets sent to the local networks.

5) Select "Hide all networks except those listed" from the "Hide from this network" pop-up menu. Input the network number of the public network in the list of networks not to hide, in this example you would list 1-1. This would hide all your local networks to any of your AURP connected remote internets.

6) Configure all other local network numbers and zone assignments.

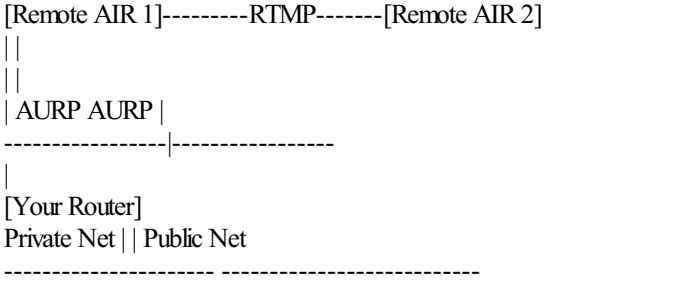
The Remote Apple Internet Router(s)

The remote router would only need to supply the address of your router and set up any options specific to their site (network number remapping, clustering, etc.).

Considerations given this configuration:

* Zones from remote sites will show up in the zone list on the local (secure) AppleTalk internet. Even though zones will show up, no services should be visible because the secure networks are hidden and thus no path exists for remote devices to respond to NBP requests.

* No routing loops can be present. In other words, no remote site could have multiple connections to your public network and also have RTMP-based connectivity between themselves.

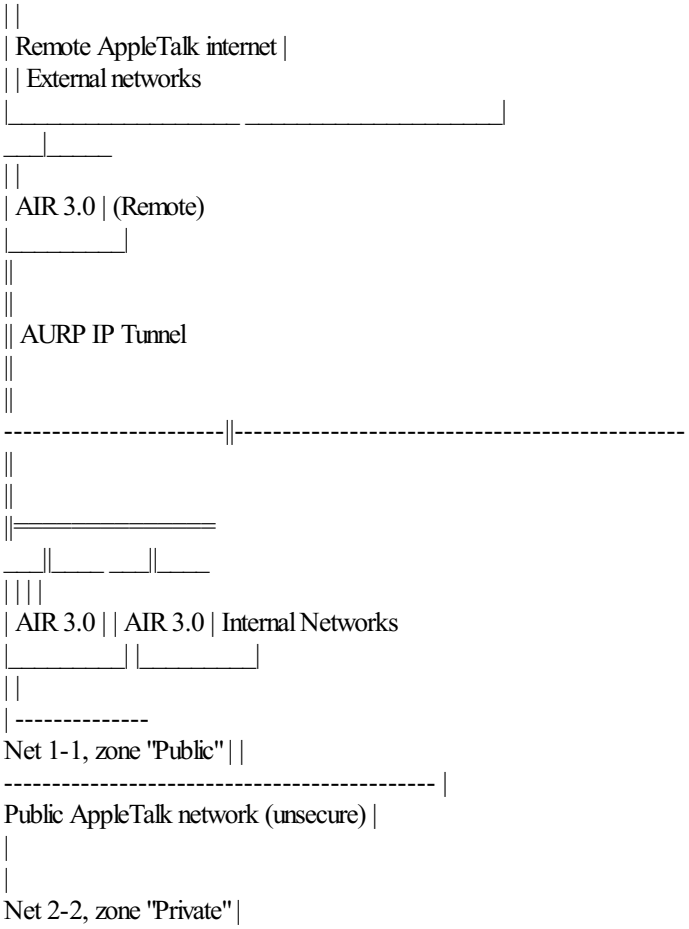


This type of configuration will not work unless you don't use network number remapping.

Private (Secured) Network

Your private (secured) network nodes would not be able to connect to other "public" networks which may be advertised on the Internet without adding another interface to the router, or by adding another router, and changing the security configuration. We just can't come up with a good general way to provide the best of both worlds such as is possible using IP.

Now let's see if I can make it a little better:



What We're trying to show here is a second Apple Internet Router connected

via IP to the local public network. This configuration offers some advantages over the first configuration.

* The biggest advantage is that your local users wouldn't be bothered seeing random zones appear because you would be connected to the public network via an IP tunnel over which you would only see a single route to network 1, and a single zone "Public". This would, for the same reason, only increase the size of a local RTMP packet by a single network entry.

* You could easily configure the second router to also connect to other "public" Internet networks -- although security would still have to be carefully thought through for your private network users. Security would need to be considered because in order to enable your private network-based users to connect to remote "public" networks, you have to supply a route back into your private networks which means they cannot be hidden. You could hide your file servers and your printers using the device hiding features of the Apple Internet Router. But NBP-based security is really not all that secure since the devices could still be attacked if someone was able to discover their network and node information.

Apple II: Transferring Data to a Macintosh Without AFE (10/94)

- **Last Modified:** October 18, 1994
- **Article:** TA29143

- **Old Article:** 1178

How can I transfer information from my Apple II to my Macintosh without Apple File Exchange or Macintosh PC Exchange?

The best way to transfer data files from an Apple IIe to a Macintosh, and vice versa, is to use Apple File Exchange (AFE) or Macintosh PC Exchange. However, AFE requires that the Apple II data first be put on 3.5" disks. If that isn't feasible, there's another way:

1. Connect the serial ports of the two computers, using a Macintosh Imagewriter cable. In the case of the Apple IIe, the connection is made a Super Serial Card. The Apple IIc, Apple IIGS, and all Macintosh computers have built-in serial ports.

2. Point the jumper block on the Super Serial Card to MODEM.

3. Run Access II (or comparable application) on the Apple II and MacTerminal (or comparable application) on the Macintosh.

4. Set one system up to send a file and the other to receive a file. Make sure both systems are set for the same baud rate, data bits, and so forth.

Sample Software Setup:

Apple II Macintosh
--- ---
TTY Mode TTY Mode
Line Feed + Carriage Return New LIne
8 Bits 8 Bits
Xon/Xoff Xon/Xoff
9600 Baud 9600 Baud
No Parity No Parity
Half Duplex Local Echo
Normal Video Underline Cursor
Wraparound Wraparound
80 Column

OnLine
Auto repeat
Modem Connection

Archived - DART 1.5.3: Version Change History

This article details the version change history for last three versions of DART.

DART has been replaced by Disk Copy 6.x, which reads and mounts DART disk images. The most recent version of Disk Copy 6.x can be downloaded from **http://asu.info.apple.com/swupdates.nsf/artnum/n11162**.

This article has been archived and is no longer updated by Apple.

What Is DART?

DART (Disk Archive/Retrieval Tool) is an application that enables you to duplicate Macintosh, Lisa, Apple II, or MS-DOS disks, save disk images, and create disks from image files. DART 1.5 can read disk image files in DART, DiskMaker, or Disk Copy 4.2 format. DART 1.5 image files are compressed, approaching a reduction in size comparable to that obtained by using a commercial compression utility. DART 1.5 is System 7.0 "savvy", and implements a custom Apple event mechanism to automate the conversion of older DART or Disk Copy files to 1.5 format. The conversion process can be run by "remote control" (even across a network!) using the accompanying HyperCard stack. (For more information, please refer to the DART User Manual.)

What's New in version 1.5.3

* Compatibility with Centris 660AV, Quadra 660AV, and Quadra 840AV.

* Compatibility with Apple Event Manager 1.0.1 (a component of AppleScript).

Note: A -64 error occurs launching DART 1.5.3 on a Power Macintosh, but if you click OK, DART continues and everything works as expected.

What's New in version 1.5.2

* Compatibility with new Macintosh Quadra 800 and Centris machines.

* Under certain circumstances, it was possible for DART to open a corrupted Disk Copy file and create an identically corrupted disk (or image file) from it. Checksums on source disk images are now verified correctly, and DART will always display a warning message if the expected and actual checksum values don't match. (Note that while a damaged Disk Copy file can no longer be converted to DART format, it's still possible to make a disk from it and potentially salvage the data on that disk.)

* Fixed a minor (but annoying) display glitch in "Multiple Copies" mode where a portion of the Status message would sometimes be "hidden" underneath the progress bar.

What's New in version 1.5.1

* Compatibility with A/UX 3.0.

* Under System 7, you can now drop a floppy disk onto DART to create an image file.

* The default filename in Save dialogs is now filled in with the volume name of the source disk (if a source has been selected.)

* Volumes can now be mounted in the Finder when DART is running in the background.

* Fixed a bug which could occasionally cause a bus error on certain machines. The error would occur either immediately on launch, or after the about box was dismissed.

* Fixed a bug which could cause DART to refuse to format a blank 1.4M floppy disk (or a 1.4M floppy formatted as 800K) when "Format Disk" was checked.

ARCHIVE

PowerBook Express Modem: Software Version History

- **Last Modified:** November 17, 1999
- **Article:** TA29160

- **Old Article:** 11803

This article has been archived and is no longer updated by Apple.

This article provides a version history of the PowerBook Express Modem software and some related support issues.

```
Software Versions:
------------------
1.0    First release. Support for PowerBook Duo 210 and 230 only.
      Includes Fax Sender 1.1

1.0.1  Added support for PowerBook 160 and 180.
      * Includes System Enabler 111 (1.0.2).
      * Improved compatibility with third party extensions.

1.0.2  European release only.

1.0.3  Italy release only.

1.0.4  Worldwide release. Includes Fax Sender 1.1.2
      * Early versions of the software had trouble with connections
        requiring parity. (Typically host connections using 7 data
        bits.) Connections requiring parity are now fully supported in
        1.0.4.
      * Fixed ring detection problem.
      * Added support for Loss of Carrier indication through the serial
        driver (SerSatus call, ctsHold byte).
      * Fixed problem with XON/XOFF flow control during error corrected
        connections.
      * Improved compatibility with US Robotics high speed modems when
        running LAP-M error correction.
      * Problems involving Fax Terminal Pref file corruption have been
        addressed in 1.0.4. Symptoms customers would experience, would
        be seeing an "X" appear through the Fax extension upon startup
        and not being able to send a fax.
      * When sending a fax, the six special dial characters (*,#,A,B,C,D)
        are now supported in the dial string.
      * Fax Sender 1.1.2 now allows you to cancel sending a fax during
        imaging. Earlier versions only allowed cancellation after
        imaging was complete.

      Problems not fixed in 1.0.4:
```

```
      * Incompatibility with Prodigy software, where Prodigy does not
        recognize the Express Modem (currently under investigation).
      * Problems have been reported using the "W" (wait for dial tone)
        and ":" (wait for calling card tone) dial commands. For example,
        calling card tones like Pacific Bell's and AT&T's are detected
        correctly, but not some others like MCI (currently under
        investigation). If you find that the tone is not being properly
        detected, you may need to enter one or more commas (,) to tell
        the modem to wait before sending the calling card number. Each
        comma represents a delay of 2 seconds.

1.1.2  Updated to include the Macintosh AV computers that now include
      the Express Modem option.

1.5.1  * Fixed the '@' dial modifier command so that it now works as
        described in the Express Modem user manual.
      * Improved throughput and reliability. Fixed a problem where
        fallback from MNP to async could fail and the Express Modem would
        hang up.
      * Removed dependency on A/ROSE. A/ROSE is no longer required.
      * Changed the default factory profile of atN value from 0 to 1.
      * Added support for GeoPort for Power Macintosh.

1.5.2  * Fixed a problem where Faxing caused hanging from time to time
        with EM 1.5/1.5.1
      * V23 rework for France (Minitel was not working well)
      * Fixed a problem where crashes appears at random in 1.5 and 1.5.1
        during the fax process or the modem power-up sequence.

1.5.3  Was released to support Japanese System Software and systems.
      * Fax blacklisting delay for Norway was too short and was
        corrected.
      * Italy and Germany line detect button was not handled properly in
        EM 1.5.2.
      * RAM Memory card > 12MBytes were conflicting with EM 1.5.2 this is
        now fixed.

1.5.4  The addition of the Fax Terminal 7.5 compatibility extension. The
      extension consists of delaying the Fax sending of documents which
      are in the "Fax Waiting To Be Sent" folder at start up time.

1.5.5  * Improvement for the PowerBook 500 series modem in Sweden and
        France. (Express Modem II only ships internationally. The Global
     Village Mercury ships in the U.S.)
      * Corrected a HDLC issue on all configurations except on PowerBook
        200 Series computers. This affected large file transfers in
        MNP/V.42 mode.
```

Using the Express Modem software with the PowerBook Fax/Data Modem

The Express Modem software includes Fax Sender 1.1.2. Fax Sender 1.1.2 is backward compatible with the PowerBook Fax/Data Modem.

Why would PowerBook Fax/Data modem users want to upgrade to the Express Modem version of Fax Sender?

- Fax Sender 1.0.1 and 1.0.3 had a problem where the Fax Page Length produced would be A4 (~12.5 inches) even though US Letter was selected. This was correc
- New Fax Quick Send feature.

When using Fax Sender 1.1.2 software on a PowerBook with a PowerBook Fax/Data Modem it is important to note that the Serial Tool extension is required. The Serial Tool is "left over" from any earlier Fax Sender 1.0.1 or 1.0.3 installation, or can be dragged into the Extensions folder manually if a 'clean' System Software & Express Modem software installation is performed.

Other Issues Involving the Express Modem

- When sending a fax it is impossible to image with a full disk. There is no workaround (rare problem). For example, sending a 14-page fax may require approximately 1MB of free disk space.
- ATL commands are not supported but will result in "OK" if used. Use the Sound Control Panel to set volume level of the speaker.
- AT&T (Self Tests) commands are documented in the "Express Modem AT Cmds" read me, but actually are not supported.
- The Express Modem was designed to work with the Communications Toolbox (CTB). The Express Modem Tool, a CTB Connection Tool, was designed to work specifically with the Express Modem. If you use an application that supports the CTB, it is preferable that you choose the Express Modem Tool, rather than selecting the Serial Tool, Apple Modem Tool, or disabling the CTB.
- The Express Modem provides compatibility for applications that do not support the CTB. Selecting "Internal Modem" in the PowerBook control panel enables applications using serial port A (External Modem Port) to communicate with the Express Modem.
- It is not necessary to explicitly turn on the modem through the Express Modem control panel. When an application attempts to use the Express Modem, the modem will automatically be turned on.

- When your computer is transmitting or receiving data or faxes, make sure that it does not go to sleep. You can select "Don't sleep when plugged in" from the Options dialog box in the PowerBook control panel.
- Fax Terminal is not set by default to receive faxes. You must first select the "Answer calls" check box in Fax Terminal Preferences in order to receive faxes automatically.
- If you have AppleTalk Remote Access installed, it is recommended that you remove the "Serial Port Arbitrator" extension from the Extensions folder inside the System Folder. AppleTalk Remote Access will still function properly. The extension just keeps track of the names of applications using serial ports for user notification.
- Applications that use a non-standard means of accessing a modem (for example, bypassing the serial driver and directly controlling the hardware, or implementing an alternate to the standard serial driver) will have no means of accessing and using the Express Modem.
- Fax Sender will turn a page in landscape mode to portrait mode before faxing. There is no work around.

Performa: Can't Use Apple Restore for External Drives (6/95)

- **Last Modified:** October 04, 2008
- **Article:** TA29185

- **Old Article:** 11848

This article has been archived and is no longer updated by Apple.

I want to place the Performa operating system onto external hard drives to allow booting Performa computers from the external drive.

It appears that Apple Restore looks for SCSI ID "0" as a destination for the restored software. This doesn't allow performing a restore to the external drive.

Is there any way to get Apple Restore to allow for restoring to external hard drives?

Apple Restore will only let you restore to the internal drive (SCSI=0). The only workaround would be to use a third-party backup program like Retrospect.

Apple Restore was written with novice users in mind to make it as easy as possible to use.

Article Change History:
08 Jun 1995 - Updated article and changed distribution status.

ProFile: Formatting Compatibility (10/94)

For what operating systems is the Apple ProFile compatible?

This article has been archived and is no longer updated by Apple.

ProFiles can be formatted for two main types of operating systems:

1. the Lisa Operating System for the Lisa

or

2. ProDOS for the Apple II, and SOS for the Apple III.

ProFiles are formatted at the factory with the Apple III SOS format and contain the Apple III System Utilities program. This format is completely compatible with the Apple II ProDOS format, and so can be used on either the Apple II or Apple III; additionally, these ProFiles can be used without difficulty on the Macintosh XL (running Lisa or Macintosh software).

Once a ProFile has been formatted by Lisa software, it will not be able to work any longer on an Apple II or III.

ProFiles don't need any special software to function with these systems other than the respective system formatters which accompany each system's operating system utilities, regardless of what system it was used on previously.

NOTES:

1. The Pascal ProFile Manager will not format a ProFile; the ProFile must already be formatted with ProDOS.

2. If you're unable to initialize a Profile for use with an Apple II or Apple III after it's been used with a Macintosh XL, check with a Level II service center: the ProFile may need reformatting.

AppleTalk Connection for Macintosh: Product Details (3/93)

This article provides system requirements, ordering and licensing information, and other product details for AppleTalk Connection for Macintosh.

This article has been archived and is no longer updated by Apple.

```
System Requirements
-------------------
* A Macintosh computer with the appropriate data link such as built-in
  LocalTalk or Ethernet, or a networking card such as the Apple Ethernet
  NB Card, Apple Ethernet LC Card, the original Apple EtherTalk Card, Apple
  Token Ring 4/16 NB Card, or the original Apple TokenTalk NB Card.
* A 1.44MB floppy disk drive such as the Apple SuperDrive
* To use the AppleTalk software, you need System 6 (version 6.0.5 or
  later) or System 7 and at least 2MB of RAM.
* To use the MacSNMP software, you need System 7 or later (4MB of RAM
  recommended). You also need an SNMP console that supports AppleTalk,
  such as those available from NEON Software and InterCon.

Product Details
---------------
Automatic Addressing
 AppleTalk devices automatically acquire their own addresses so that the
 user doesn't need to learn how to set addresses.

AppleTalk Zones
 AppleTalk supports a resource-grouping feature called zones, which allows
 easier access to resources in large internetworks.

The SNMP agents included in this product support the following Management
Information Base (MIB) definitions:
* Parts of the AppleTalk MIB (RFC 1243): LLAP, AARP, ATPort, DDP, NBP, and
  ATEcho groups
* Parts of the TCP/IP MIB-II (RFC 1213): System, Interfaces, and SNMP
  groups
* Macintosh System MIB (defined by Apple)

SNMP over TCP/IP
 To manage Macintosh computers over the TCP/IP protocols, you need Apple's
 TCP/IP Connection software.

Ordering and Licensing Information
----------------------------------
AppleTalk Connection and the other products in the Connection series are
available as retail products consisting of a single-user package with
multi-user license extensions. A MacSNMP developer product is available
from APDA.

AppleTalk Connection for Macintosh
Single-user package (Order No. M8069Z/A)
* AppleTalk stack and driver software
* MacSNMP Client

StyleWriter II: Executive Paper Size

- **Last Modified:** August 24, 2000
- **Article:** TA29192

- **Old Article:** 11860

This article has been archived and is no longer updated by Apple.
The StyleWriter II manual states that the Executive paper size is 7.5-in.by 10.5-in., but the Page Setup dialog shows it as 5.5-in. by 8.5-in.
Version 1.2 of StyleWriter driver has been changed to use 7.5-in.w x 10.5-in.h as the Executive paper size. Apple has decided to standardize on that size for all Apple printers.

If you want to modify the StyleWriter II driver to use the 7.5-in.w by 10.5-in.h paper size, the best way is to modify the StyleWriter II PREC id=3 resource. Just change the paper height and width values of Btn 3 to 1260 (105x12) and 900 (75x12), respectively.

Easy Access: Slow Keys Appears to Prevent Keyboard Input

I lose the ability to input data from the keyboard after entering numerous hard returns in Microsoft Word or TeachText. I hear a beep, then the keyboard won't accept any more keystrokes, it just makes a strange beep. Even quitting the application doesn't fix it.

This doesn't happen with extensions off, but occurs even immediately after a clean install.

This article has been archived and is no longer updated by Apple.
This is a feature of Easy Access called Slow Keys. Slow Keys gets turned on whenever the return key is held down for 8 consecutive seconds (there's a warning beep after 4 seconds). Thus, even though all features of the Easy Access control panel may be off, Slow Keys can still activate itself.

Slow Keys is supposed to prevent accidental key presses by waiting a brief amount of time before accepting a keystroke. This delay makes it appear as though the keyboard is locked up.

When this happens, turn off Slow Keys in the Easy Access control panel (the mouse will still be functional). Be aware, however, that holding the return key down again for another 8 seconds will turn it back on. The long-term solution is simply to disable or remove Easy Access.

Macintosh: DOS, OS/2, and Windows Compatibility (3/93)

I hear that Macintosh computers are compatible with MS-DOS and Windows computers. How does Apple define compatible?

This article has been archived and is no longer updated by Apple.
The best way to start answering these questions is to determine what you are really asking about when you discuss compatibility. There are two questions to ask when defining levels of compatibility:

*Do you want to use MS-DOS or Windows files on a Macintosh?

* Do you want to run MS-DOS applications (software programs) on a Macintosh? The essential ingredients that ensure compatibility come with your Macintosh Performa computer: a SuperDrive disk drive and Macintosh PC Exchange software.

Every Macintosh has a built-in SuperDrive, which can read and write to DOS, Windows, OS/2, and Apple II formatted 3.5-inch floppy diskettes. These floppy diskettes can be 400K, 800K, or 1.44MB in capacity. Macintosh PC Exchange is included in the System software that comes with every Macintosh Performa, Power Macintosh and other selected Macintosh models.

With Macintosh PC Exchange users can easily work with files stored on DOS or Windows floppy disks. You can move files between a Macintosh and PC as easily as you can between two Macintosh computers. By creating program links, you can directly launch a Macintosh program and translate a file by simply double-clicking on your PC file. You can even format floppy disks in DOS or Windows format on your Macintosh using Macintosh PC Exchange.

If you want to run MS-DOS applications on your Macintosh, you will need an additional program such as SoftPC or SoftWindows (for the Power Macintosh series) from Insignia Solutions, Inc.

To locate a vendor's address and phone numbers, use the vendor name as a
search string in the Apple Tech Info Library.

Article Change History:
25 March 1994 - Revised and retitled to reflect additional Macintosh models in addition to the Performa series.

Macintosh Performa: System Disks Not Included (7/95)

- **Last Modified:** July 10, 1995
- **Article:** TA29211

- **Old Article:** 11887

This article has been archived and is no longer updated by Apple.

I just purchased a Performa computer, and I think I'm missing something from my package. Where are the system disks? And where are the master disks for the application software that was included with my Performa? Everything is on the hard drive, but what happens if something happens to the software there?

You are not missing anything. The Performa line of computers comes with Apple Backup, a software utility that allows you to backup the entire hard drive, including system software and application software, onto high density floppy disks. You can buy blank floppy disks at many office supply stores, as well as from computer retailers.

Many later Performa computers come with the Performa Backup CD. Computers that include the Performa Backup CD are:

Macintosh Performa 550 (later versions)
Macintosh Performa 575, 577, 578
Macintosh Performa 630CD, 635CD, 636CD, 637CD, 638CD
Macintosh Performa 5200 series
Macintosh Performa 6110CD, 6112CD, 6115CD, 6118CD

This disc contains all the software that is pre-loaded on your hard drive including system software and third party programs. If you have this disc, it is not necessary for you to run the Apple Backup program to back up your pre-loaded software. However, you should still back up your personal files and any other software you add later.

If at some time you remove software from your computer, you will need to use the backup disks you create and run the Apple Restore program or use the Performa Backup CD to restore the software. This procedure will restore all the programs, but will replace them so that there are no duplicate copies on your hard drive. You will not lose any personal files.

Backing up regularly is a good habit to get into, as it provides a way for you to recover important documents that you have created, as well as system software and applications, should anything ever happen to your hard drive.

Article Change History:

10 Jul 1995 - Updated to include Performa Backup CD information.

TA29224_Macintosh_LC_III_FPU_Configurations_with_PDS_Cards_(793)_(TIL11904).pdf

Archived - Macintosh LC III: FPU Configurations with PDS Cards (7/93)

A Macintosh LC III (Performa 450) can potentially have two FPUs: one on the logic board, and another on an expansion card. This article describes the four possible combinations of FPU (on logic board and on add-on card) in a Macintosh LC III.

This article has been archived and is no longer updated by Apple.
* No FPU on the logic board, and none on the expansion card. No problem.

* No FPU on the logic board, but one on the expansion card. The system uses the one on the card -- at 16 MHz.

* An FPU on the logic board, but none on the expansion card. The system uses the one on the logic board -- at 25 MHz.

* Two FPUs: one on the logic board, and one on the expansion card. Both FPUs are on the processor bus. There's no way to predict which one will respond to a given FPU cycle, and no way to assign priority.

Apple does NOT recommend removing an FPU from an expansion card and installing it on the logic board. Expansion card FPUs are 16 MHz, but the logic board requires a 25-MHz FPU.

If, after installing a card with an FPU, your system crashes, contact the vendor of the card to determine if there are any known incompatibilities between that card and the Macintosh LC III.

Article Change History:
07/13/93 - Revised to include Performa 450.
06/24/93 - Revised in response to input from Apple Engineering.

Archived - Language Kits: Unreadable Text

Why text may appear unreadable in the Chinese or Japanese Language Kits. This discussion uses the Japanese Language Kit as an example.
This article has been archived and is no longer updated by Apple.
When the Japanese Language Kit is installed, there are instances when Japanese text is unreadable (for example: é*éãéªé*). This occurs when an English font is used for Japanese text. In some instances, the issue can be fixed, in others not.

Japanese Font System Basics
Please check the following basic points to make sure the Japanese font system is complete:

Kanji Bitmap Fonts In Root Level Of System Folder
The "fbit/fdef" Kanji bitmap fonts (the one with the Kanji character "kan" and the circle behind it icon) are at the System Folder root level (not Fonts folder). At minimum, the Osaka (*Beijing* or Taipei for Chinese Language Kit) font must be installed.

InputBackSupport in Extensions
The InputBackSupport extension is installed in the Extensions folder.

Make Unreadable Fonts Readable
Following are situations where unreadable Japanese text can be made readable:

Filenames In Finder Windows:
Open the Views control panel and select a Japanese font (for example, Osaka).

Note: There is a side effect in choosing a Japanese font in the Views control panel. Certain accented character and symbols (Ä and ¬) will be replaced by another character. This occurs because Japanese fonts have a different character mapping of the upper ASCII table than Roman fonts.

Japanese Application Menu Bar And Dialog Boxes:
Applications have a resource that tells the system for which language the application was written. The system uses the information to select the proper font. In some case, this resource was not properly set and the system has assumed English as the application's language. Use the Japanese Language Register (or Chinese Language Register) application to register the application as Japanese (or Chinese). NOTE: Some applications hard-code the font to be used, for example in text entry window or font list. In this case, the Japanese Language Register will not correct this misused font.

Unreadable Text That Cannot Be Made Readable
The following are situations where Japanese text shows up as unreadable and there is no fix:

Unreadable Text In Menus And Dialog Boxes
Unreadable text will occur in the menus and dialog boxes. For example, the Applications Menu showing an application with a Japanese name. These areas of the system were not designed to support multiple scripts (writing systems). You will see this with the Kotoeri alert messages. The alert dialog box routine uses the primary script to display the message.

TA29318_ProFile_interface_card_for_Apple_III_Pinouts_(1094)_(TIL01204).pdf

ProFile interface card for Apple III: Pinouts (10/94)

What are the pinouts for the Apple /// ProFile Interface Card?

This article has been archived and is no longer updated by Apple.
The pinouts for the ProFile card are as follows:

1 PHI 13 XD7
2 GND 14 GND
3 TRw 15 PSTRB (low = true)
4 GND 16 BSY/INT (low = true)
5 XD0 17 CMD (low = true)
6 XD1 18 RPARITY (low = true)
7 (not used) 19 GND
8 XD2 20 GND
9 GND 21 CRES (low = true)
10 GND 22 XD3
11 XD5 23 XD4
12 XD6 24 GND
25 CDET (low = true)

The cable to the ProFile is pin-to-pin straight through.

Color Classic: Apple File Exchange Error Message (8/93)

- **Last Modified:** August 31, 1993
- **Article:** TA29319

- **Old Article:** 12040

Article Created: 4 May 1993
Article Reviewed/Updated: 30 August 1993

On the Macintosh Color Classic, opening Apple File Exchange sometimes gives a type 1 error or the message "Application unknown has unexpectedly quit." You need to install the Hardware System Update to resolve this.

There's a known problem with the Color Classic and Apple File Exchange, where Apple File Exchange will crash or not operate correctly. The problem was fixed in the Hardware System Update. Install the Hardware System Update on a Macintosh Color Classic to fix the Apple File Exchange problem.

Without the update, there were problems when running in both 24- and 32-bit mode. However, a crash normally only resulted when running Apple File Exchange in 24-bit mode. This is why some articles suggested running in 32-bit mode with Apple File Exchange on a Color Classic.

Installing the Hardware System Update resolves this issue, and the Color Classic can then run in either 24- or 32-bit mode.

You can find the Hardware System Update on AppleLink following this path:

Software Sampler
Apple Software Updates
Macintosh
Supplemental System Software

TA29319_Color_Classic_Apple_File_Exchange_Error_Message_(893)_(TIL12040).pdf

Macintosh PC Exchange: Version 1.0.2 Update (5/93)

- **Last Modified:** July 02, 1993
- **Article:** TA29323

- **Old Article:** 12048

Article Created: 5 May 1993

This article discusses version 1.02 of Macintosh PC Exchange.

Version 1.0.2 resolves several technical problems reported by PC Exchange customers and is available to customers at no charge.

Mac PC Exchange 1.0.2 doesn't include any new features or enhancements over the previous version 1.0.1, but incorporates fixes for the following problems:

* PC Exchange 1.0.1 wouldn't recognize certain brands of pre-formatted PC floppy disks. Instead, PC Exchange asked users if they wanted to initialize the floppy disk. Version 1.0.2 of PC Exchange should now recognize all brands of PC-format floppy disks, regardless of the method used to pre-format the disk.

* Occasionally, the first file that users selected from a locked, PC-format floppy disk wouldn't open, or the content of the document would appear as garbage characters. If users unlocked the floppy disk, all files on the PC-format disk would open without difficulty. With version 1.0.2 of PC Exchange, you can open documents from a locked, PC-format floppy disk without problems.

* When PC Exchange initializes a floppy disk that is damaged, the initialization process can take a long time to update the damaged disk. Version 1.0.2 of PC Exchange displays a new message while a damaged disk is being updated. This message reports the progress of the disk update and gives the option to cancel the disk initialization.

* If there isn't enough free space in the application heap, a format failure or system crash could occur when PC Exchange is formatting a PC

floppy disk. This problem shouldn't occur with version 1.0.2 of PC Exchange.

The Macintosh PC Exchange 1.0.2 update kit includes an 800K program disk and a cover letter.

Printing Differences: Lines Per Inch and Dots Per Inch (5/93)

Article Created: 11 May 1993

The Apple Color Printer spec sheet says the printer has 360 dots per inch, but it also says the printer has 65 screen lines per inch. Can you explain the difference between lines per inch and dots per inch?

This article has been archived and is no longer updated by Apple.

Dots per inch (dpi) represent the quantity of dots per inch a printer is capable of putting onto paper. Dots per inch is also known as the resolution of the printer.

Lines per inch (lpi) represent the number of halftone dots (per inch) that a screen contains Lines per inch is also referred to as the screen frequency or screen ruling.

The halftone dot is quite different from the dpi dot. The halftone dot can actually be a variety of shapes: lines, ellipsoids, squares, dots, random flecks, and a variety of other solid black shapes. Typically dots and ellipsoids are used. However, for the more artistic representations other shapes are often used. The number of shapes per inch is measured by lines per inch, that is, shapes per inch equals lines per inch.

With the exception of daisy wheel type printers, output from computers has always been based on a quantity of dots placed together to represent alphanumeric characters and graphics. The first printers of this nature were the dot matrix printers. Laser printers and ink jet printers use this same principal. The laser and ink jet dots are smaller than the dot matrix printers, but they work the same way. The number of dots these printers produce is the measured in the dots per inch (dpi) notation.

Prior to the use of the dot based printers the pre-press/printing industry used various methods of placing solid forms of ink onto paper (gravure, letterpress, offset, and so on.). These methods do not use dots to form the alphanumeric characters. Similar to the daisy wheel printers, the characters are fully formed ink impressions. The problem with using solid ink comes when attempting to print graphic images which consist of more than solid lines or solid blocks (line art). Some method to vary the amount of ink placed on the paper is needed in order to represent various levels of gray. Otherwise, printing photographs and other continuous tone artwork would not be possible.

To address this need, a technique was developed to print various sized black halftone dots on the paper. An area of various sized, solid black halftone dots will trick the eye into thinking it is seeing various levels of gray.

In the traditional technique used to create these various sized dots a screen is placed over the photographic enlargement paper to break the continuous-tone photograph into halftone dots. A screen can best be described as a sheet of plastic which contains the inverse (negative) gray scale pattern of halftone dots. This sheet of semi-transparent plastic allows varying amounts of light to pass through and contact the photographic paper placed beneath it. In the computer technique, there is no physical screen used. The halftone dots are created via computer image processing.

The number of halftone dots in the screen is represented by the lines per inch (lpi) measurement. That is, 65 halftone dots per inch equals 65 lines per inch. The number of halftone dots per inch for a screen can vary. Typical values are 65 lpi for newspaper photograph halftones to 200 lpi (or higher) for art reproduction books.

There is a relationship between dpi and lpi. The relationship exists as a limit. The lpi of a printer will always be less than the dpi of the printer, because the halftone dot is composed of a matrix of the dpi dots. Higher dpi does not directly indicate higher lpi, only the possibility of higher lpi. Both a 300 dpi printer and 600 dpi printer can produce halftone dots of (possibly) 53 lpi, 75 lpi, 83 lpi, 106 lpi, and 150 lpi, but the 600 dpi printer would be able to produce additional, higher lpi.

AppleCD 300: SCSI-2 Support

- **Last Modified:** January 13, 2000
- **Article:** TA29338

- **Old Article:** 12078

Is the external AppleCD 300 compatible with the SCSI-2 interface standard?
Yes, the external AppleCD 300 drive does use the industry standard SCSI-2 interface. This standard addresses both the electrical interface and command protocols to this drive.

SANE: Technical Product Description (2 of 2) (10/94)

- **Last Modified:** October 18, 1994
- **Article:** TA29374
- **Old Article:** 1216

This article has been archived and is no longer updated by Apple.

This article describes the Standard Apple Numeric Environment (SANE).

III. Choosing a Data Type:

Typically, picking a data type requires that you determine the
trade-offs between:

* fixed - or floating-point form
* precision
* range
* memory usage
* speed

The precision, range, and memory usage for each SANE data type are shown in the table of SANE types below. Effects of the data types on performance (speed) vary among the implementations of SANE.

Most accounting applications require a counting type that counts things (pennies, dollars, widgets) exactly. Accounting applications can be implemented by representing money values as integrel numbers of cents or mils, which can be stored exactly in the storage format of the COMP (for computational) type. The sum, difference, or product of any two comp values is exact if the magnitude of the result does not exceed 2^63 - 1 (that is, 223,372,036,854,775,807). This number is larger than the U.S national debt expressed in Argentine pesos. In addition, comp values (such as the results of accounting computations) can be mixed with extended values in floating-point compitations (such as compound interest).

Arithmetic with comp-type variables, like all SANE arithmetic, is done internally using extended-precision arithmetic. There is no loss of precision, as converson from comp to extended is always exact. Space can be saved by storing numbers in the comp type, which is 20 percent shorter than extended. Non-accounting applications will normally be better served by floating-point data formats.

IV. Values Represented:

The floating-point storage formats (single, double and extended) provide binary encodings of a SIGN (+ or -), an EXPONENT, and a SIGNIFICAND. A represented number has the value

+/-significand = 2 exponent

where the significand has a single bit to the left of the binary point (that is, O <- significand < 2).

V. Range and Precision of SANE Types:

The table below describes the range and precision of the numeric data types supported by SANE. Decimal ranges are expressed as chopped two-digit decimal representations of the exact binary values.

SANE DATA TYPES

TYPE CLASS APPLICATION ARITHMETIC

Type Identifier Single Double Comp Extended

Size (bytes:bits) 4:32 8:64 8:64 10:80

Binary exponent
range
Minimum -126 -1022 --- -16383
Maximum 127 1023 --- 16383

Significand precision
Bits 24 53 63 64
Decimal digits 7-8 15-16 18-19 19-20

Decimal range
(approximate)
Min negative -3.4E+38 -1.7E+308 9.2E18 -1.1E+4932
Max neg norm -1.2E-38 -2.3E-308 -1.7E-4932
Max neg denorm -1.5E-45 -5.0E-324 -1.9E-4591

Min pos denorm 1.5E-45 5.0E-324 1.9E-4951
Min pos norm 1.2E-38 2.3E-308 1.7E-4932
Max positive 3.4E+38 1.7E+308 9.2E18 1.1E+4932

Infinitive Yes Yes No Yes

NaNs Yes Yes Yes Yes

Usually numbers are stored in a normalized form, to afford maximum precision for a given significan width. Maximum precision is acheived if the high order bit in thr significand is 1 (that is, 1</- significand < 2).

Archived - PowerBook: SCSI Bus, Termination, and Termination Power

This article provides technical information on the following topics, as they relate to PowerBook (including Duo) computers:

- PowerBook Termination and SCSI Disk Mode
- PowerBook Termination Power
- SCSI System Cable and Adapter

This article has been archived and is no longer updated by Apple.

PowerBook Termination and SCSI Disk Mode

On most PowerBook computers, termination is supplied by the internal hard drive termination. However, PowerBooks using IDE (ATA) hard drives lack SCSI termination. This includes the PowerBook 1400 series and PowerBook 3400 series (see note).

PowerBook computers depend on the internal hard drive to supply termination, so that they are properly terminated when placed in SCSI disk mode. In SCSI disk mode, the PowerBook is just another hard drive in the SCSI chain, because all other subsystems have been shut down.

With the introduction of IDE (ATA) specification internal hard drives in PowerBook computers it is necessary to supply double-termination to the SCSI bus. When connecting a device with internal termination an extra external terminator should be placed between the cable and the device. If the device lacks internal termination a total of two external terminators are required. One should be placed between the cable and the device, and the second terminator should be applied to the second port on the device.

*Double-termination does not apply to Disk Mode or Target Mode applications.

Because the PowerBook is internally terminated by the hard drive, it must always be at the end of the SCSI chain. If you have two PowerBook computers and other devices on the chain, one PowerBook must be the very last device in the SCSI chain (in SCSI disk mode) and the second PowerBook must be at the beginning of the chain. It is not possible to have more than one PowerBook on a single SCSI bus in SCSI disk mode.

PowerBook Termination Power

Some all-in-one PowerBook computers and the Duo series supply termination power. Those models that do not supply termination power rely on external devices to provide termination power on the bus. Because termination power is not supplied by these PowerBook computers, Apple advises that you do not have powered-off devices on the bus.

PowerBook Duo computers, the PowerBook G3, PowerBook G3 Series, PowerBook 3400 and PowerBook 2400 do not rely on an external device to provide termination power. The DuoDock provides termination power to the bus. They are actively terminated, which means they provide termination power and have the best architecture for termination of any other device on the bus.

SCSI System Cable and Adapter

Apple's SCSI cables are built to tight specifications to minimize electrical noise on the SCSI bus. The wires are laid out to provide minimal signal degradation. Poor quality cable construction may lead to intermittent SCSI operation and potential system crashes.

HDI-30 Adapter SCSI Cable (socket) & HDI-30 SCSI Cable (plug)
* Material: 30 conductors 26 AWG 90% braid plus foil shield.

Note

For the PowerBook 1400, it is necessary to supply double-termination to the SCSI bus. When connecting a device with internal termination an extra external terminator should be placed between the cable and the device. If the device lacks internal termination a total of two external terminators are required. One should be placed between the cable and the device, and the second terminator should be applied to the second port on the device.

*Double-termination does not apply to Disk Mode or Target Mode applications.

For electrical, mechanical, and shielding specifications, see the following Tech Info Library article:

TA29435_Apple_IIGS_Graphics_Modes_(1094)_(TIL01225).pdf

Apple IIGS: Graphics Modes (10/94)

What are the available graphics modes available on the Apple IIgs?

This article has been archived and is no longer updated by Apple.
The Apple IIGS can perform graphics under a number of different types of graphics displays: Lo-res and Hi-res modes found on all Apple II systems, the double Hi-res mode available on the Apple IIe and IIc, and new Super Hi-Res modes.

Both Lo-res and Hi-res modes are unchanged from the Apple II, and the manual "Applesoft on the IIGS" shows the commands for using those modes. The IIGS ROM doesn't have routines for the use of double Hi-res graphics; a programmer must add assembler routines that will properly draw lines, locate points, etc., in double Hi-res mode. Commercially available packages include these routines.

Only on the Apple IIGS performs in Super Hi-Res graphics modes with a resolution of 320 X 200 or 640 X 200. Using 320 X 200 mode permits a full 16 colors per line. 640 X 200 mode can also use 16 colors per line, but each pixel is limited to a choice of 4 of the 16 colors. Both modes are supported by the Apple IIGS QuickDraw II tools. To make programming easier, screen memory is mapped contiguously in Super Hi-Res mode.

320 X 200 Super Hi-Res mode

Each line of pixels in 320 mode is associated with a table of 16 entries that correspond to the 16 colors to be shown on that line. Each entry represents one of the possible 4096 colors available on the Apple IIGS. There may be as many as 16 color tables defined, permitting 256 colors on the screen at one time.

Within each line, a byte determines two pixels' colors. The high 4 bits of a byte contain a number from 0 to 15, which is used as an offset into the color table for that line. The pixel mapped to that memory location will have the color found at the appropriate table location. Similarly, the low 4 bits of that byte will determine the color of the adjacent pixel.

Pixels in 320 mode are almost square. The aspect ratio in this mode is 5:6 on an Apple Monochrome Monitor, an AppleColor Monitor, or an Apple RGB Monitor.

640 X 200 Super Hi-Res Mode
---
640 mode also allows 16 colors per line, but each pixel is limited to one of four colors (this mode is sometimes called Limited 16 Colors). As in 320 mode, each line addresses one of up to 16 color tables. However, each pixel in the line is represented by only 2 bits, so that each byte contains information about 4 pixels.

To represent 4 adjacent pixels, bits 7 and 6 choose from among colors 0 through 3 in the appropriate color palette, bits 5 and 4 choose colors 4 through 7, bits 3 and 2, from colors 8 through 11, and the last two bits choose from colors 12 through 15. Therefore, each pixel can be one of four colors, but there may be a total of 16 colors on each line.

The pixel aspect ratio in 640 mode is 5:12 on an Apple monitor, so that each pixel's height is approximately twice the width.

Color Fill Mode

The Apple IIGS can also use 320 X 200 mode with color fill. If this mode is chosen, the color zero (0) takes on a special meaning. A pixel with color 0 will have the same color as the preceding pixel, so that a series of bytes with value 80 00 00 would all be shown in the color represented by the eighth entry in the color palette. Using 0 to represent no color change limits the selection to only 15 colors per line, but does save time for the programmer.

Apple III and ProFile: Running Them on an Inverter (10/94)

Can I run my Apple /// and ProFile on an inverter?

This article has been archived and is no longer updated by Apple.
The Apple III and ProFile may both be run on an inverter that produces either a square or a sinusoidal wave.

The Apple III itself works on an inverter without any problems, as long as the inverter has sufficient current capacity. The Apple III has a switching power supply and will therefore tolerate power fluctuations and line noise without any trouble, as long as it's receiving a minimum of 95 volts.

The ProFile, on the other hand, is somewhat more sensetive to power flucuations and line noise. If you use your ProFile with an inverter that produces a square wave, take care that:

1. Make sure that the inverter can supply at least 8 amps, since 5 amps is the minimum power required to start up the ProFile.

2. If you wish to use square-wave power, which is by nature quite noisy, use a noise suppression kit so that no unnecessary noise reaches the ProFile power supply and prevents the ProFile from coming Ready. Your noise suppressor must have a minimum capacity of 10 amps.

NOTE:
You can avoid the necessity of noise suppressors by running your ProFile on DC power if you wish. To do so, however, you will need to regulate the +12V from a car battery, as well as generate and regulate +5V and -12V.

Notes
---
* This is a theoretical maximum synchronous sustained data transfer rate. The practical data transfer rate varies depending on many factors, such as SCSI chip transfer rate limit, SCSI driver used, hard drive performance, software applications, cables, and other configurations.

Note (1)
The transfer rate of the 53C96 can reach 6MB/sec when using a fast hard drive, provided the cabling is capable of supporting that speed. The cabling and termination of the internal SCSI bus are optimized so that the 53C96 that controls the internal bus can support data transfers at a faster rate (up to 5MB per second with existing faster third-party hard drives). Externally with standard Apple cables, SCSI throughput was rated at 4 MB per second. The improved SCSI performance results in increased system responsiveness when accessing large amounts of data on a fast hard drive.

Note (2)
The internal SCSI channel also supports active termination which improves SCSI bus signal quality and reliability through improved transmission line and terminator design. This means that only one terminator is needed at the end of the external SCSI chain. The external channel's termination

also offers a more uniform impedance and cleaner termination scheme. However, because external cabling and termination are less predictable, performance on the external bus could be lower than the internal. Electrically isolating the two channels ensures that changes in external cabling and termination don't impact the performance of the internal devices.

Note (3)
Even though the internal and external SCSI chains are physically different, they are still logically the same, and can therefore, like all Macintosh systems, accommodate up to seven SCSI devices. The added value of the Macintosh Quadra 950 dual-controller design is that the internal hard drive(s) performance won't be affected by problematic devices (like a scanner) attached to the external SCSI connector. Improvements in signal quality on the SCSI bus result in higher SCSI reliability.

Note (4)
The PowerBook 150 only supports external SCSI devices, the internal hard drive is an IDE type drive.

Note (5)
The Macintosh 630 family utilizes an internal IDE hard drive, SCSI is only valid for external drives. The transfer rate external approaches 5 MB/sec.

Note (6)
These computers have dual-channel asynchronous SCSI. There are two completely separate SCSI buses. The Fast SCSI bus is for internal SCSI connections only. The other SCSI bus is for both internal and external SCSI connections.

Macintosh PC Exchange: Supports 5.25-inch Drives (6/93)

- **Last Modified:** June 18, 1993
- **Article:** TA29484

- **Old Article:** 12340

Article Created: 16 June 1993

The back of the PC Exchange box says that it "Works with 3.5-inch and 5.25-inch floppy disks formatted using MS-DOS, Windows, and OS/2." Also "Formats 360K or 1.2MB MS-DOS disks on any Macintosh with a third-party 5.25-inch external floppy disk drive."

Does Macintosh PC Exchange work with 5.25-inch PC drives? We've been told repeatedly that it doesn't work with any 5.25-inch drive, including the Apple 5.25-inch drive.

Macintosh PC Exchange works with external 5.25-inch low- and high-density drives from these third-party manufacturers:

Peripheral Land, Inc.
Dayna Communications
Kennect Technology

For Macintosh PC Exchange to work properly, you must install the third-party software (that is, driver) that comes with those drives.

Macintosh PC Exchange doesn't work with the "old" Apple 5.25-inch drive (customers will continue to have to use Apple File Exchange), nor with any 5.25-inch Macintosh LC (really, Apple II) drives.

This information should supersede all other information you've seen reported on the compatibility of Macintosh PC Exchange with 5.25 PC drives.

Note that there's one little-known problem when using Macintosh PC Exchange with Dayna Communications' DOS Mounter. High-density disks aren't supported with the currently shipping version of Macintosh PC Exchange, version 1.0.2. This incompatibility will be fixed in a future version of Macintosh PC Exchange.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

TA29489_Apple_III_Interfacing_a_LaserWriter_and_III_E-Z_Pieces_(1094)_(TIL01235).pdf

Apple III: Interfacing a LaserWriter and III E-Z Pieces (10/94)

The following describes the connection between III E-Z Pieces on the Apple III and the LaserWriter.

This article has been archived and is no longer updated by Apple.

I. Apple III:

A. Driver: .RS232
1. Data Configuration Block:

0 1 2 3 4 5 6 7 8 9 A B
-- -- -- -- -- -- -- -- -- -- -- --
0E 00 00 00 00 80 13 11 DF 84 50 00

No parity is set automatically in the Printer Mode.

II. The Connection

1. Cables

A. Connect Modem Eliminator Cable (Part #590-0166) to the connector on the back panel of the Apple III.

B. Connect the Serial and Communications Cable (Part #590-0037) to the connector on the Laserwriter.

C. Connect the remaining ends of the two cables together.

D. Here is a diagram of the connection:

From: To:

Apple III LaserWriter

Back panel Serial Port
DB-25 connector DB-25 connector

signal - pin wiring pin - signal

Frame Ground 1 <-> 1 Frame Ground
Tx 2 <-> 3 Rx (Receive Data)
Rx 3 <-> 2 Tx (Transmit Data)
RTS 4 <-> 4 RTS (Ready To Send)
Signal Ground 7 <-> 7 Signal Ground
DTR 20 <-> 20 Tx (Transmit Data)

III. LaserWriter

1. Set the Selector Switch on the LaserWriter to "Special". This can be done without turning off the printer. In Diablo 630 emulation mode the LaserWriter uses 9600 baud, XON/XOFF protocol, and no parity.

IV. Verification

1. To verify the connection, turn on the III, video monitor, and LaserWriter. Boot III E-Z Pieces and choose "Other Activities" from the Main Menu. Add a custom printer, naming it LaserWriter.

Use these settings for this custom printer:

1. Needs line feeds after each Return No
2. Accepts top-of-page commands Yes
3. Stop at end of each page No
4. Platen width 8.0 inches
5. Printer codes Yes

The printer codes for the Diablo Emulation are in the LaserWriter Technical Description. If you specifiy no printer codes, the typeface will default to Courier standard, 12 characters per inch, monospaced.

2. Return to the Main Menu and try to print a document.

3. Be aware that when you use the 3E-Z Pieces command OA-H (for hard copy), you will have to print a document using OA-P before you may use the OA-H command again. This is because the command OA-H does not issue the form feed the LaserWriter needs to clear its Diablo emulation settings.

Apple Workgroup Server 95: How Mount Points Work

- **Last Modified:** August 07, 2000
- **Article:** TA29580

- **Old Article:** 12483

This article has been archived and is no longer updated by Apple.

How do mount points work on the Apple Workgroup Server (AWS) 95?

UNIX file systems are hierarchical with only one root, the startup volume. If there is more than one physical disk (or partition) all volumes must be connected to that startup volume. These connections are made with mount points. The administrator chooses a folder on the startup volume for each additional volume to connect to (by default, this is "/ Shared Data"). The additional volume then appears as a folder within the chosen folder (this is the mount point).

Since AppleShare Pro runs atop the A/UX file system, there is one special consideration when sharing. Folders with mount points in them can not be shared. This includes the A/UX startup volume (which has the Macintosh startup volume mount point in it).

If all mount points are created within the Shared Data folder, then you would normally share each folder within the Shared Data folder within AppleShare Administrator.

AWS 95 - A/UX: Remove File with 8-Bit, Option Characters (5/95)

I have special Macintosh characters in my file names on my Apple Workgroup Server (AWS) 95 Disk, such as "Àrich".

When I try to remove them from the command shell by the command:

rm Àrich

OR

rm "Àrich"

I am prompted, "Use 'exit' to leave csh". How can I remove these files from the command shell or startup shell?

This article has been archived and is no longer updated by Apple.
You can create, copy, or rename file names with a special character -- such as the trademark character -- under the A/UX 3.x Finder. Under CommandShell running the default shell, csh, you cannot EXPLICITLY specify the file name with a special character on the command line since this special character cannot be recognized by the CommandShell. Hence, you get the "Use exit to leave csh" message.

Additionally, the option 8, "*" is usually translated into a period in the CommandShell environment, but with the environment variable TBSEEDOTS=1 set in A/UX 3.1.1, this character is translated to "," in the CommandShell environment. If the usual delete commands "rm" or "rmdir" are used to remove one of these files, the CommandShell may report that the file with these characters is nonexistent, even though you can see it both from the Finder and by using the "ls" command in the command shell.

Here is how to remove eight bit characters like ã, ┤, *,╩¤, and ┐ in a file's name under AWS 95 A/UX CommandShell or A/UX Startup Shell.

Under A/UX CommandShell
═══════════════════════

Option 1

No matter which CommandShell you are using, you can do:

```
ls -li # To list all files in a directory, and find the inode number
. # that the 8-bit character file name you are going to delete.

find . -inum inode-number(s) -exec rm {} \\; # This will remove all files
. # with the correspondent
. # inode.
```

NOTE: The inode-numbers(s) are the inode numbers you found with 'ls -li', for example remove files with inode numbers 100, 120, 140, and 155. Below is an example of the command to remove files with inode numbers 100, 120, 140, and 155.

```
find . -inum 100 120 140 155 -exec rm {} \\;
```

Option 2

Under Korn Shell (ksh), you can explicitly remove that file, for example, try to remove the ¢abcã file.

```
% ls -FC
--> ¢abcã
$ ksh
$ rm *abc*
```

or

```
$ rm ¢abcã
```

If the file name contains space(s), you may use single quotes to enclose the name. Below is an example:

$ rm '¢ a b cã'

Under A/UX Startup Shell

Sometime it may necessary to go into the Startup Shell to remove or move files, if the system crashes as a result of a eight bit character file name in the System Folder, and these files need to be removed or moved to some other directory. To get into the Startup Shell, press Command-"." (period) to stop the A/UX start up process while A/UX Startup is launching; you will then get to the "startup#" prompt. Since the 'find' command is not available in A/UX Startup Shell, use the 'rm -ir' command, and answer no to all the files in the directory except the offending file.

startup# cd to-a-directory
startup# rm -ir .

NOTE: There is a space and period following the r.

WARNING: This command does a recursive delete of the current directory asking for permission for every file. DO NOT FORGET THE "-i" OPTION because the -r option alone recursively deletes the entire contents of the specified directory, and the directory itself.

DAL For AS/400 & SNA■ps 5250: Improve Performance

- **Last Modified:** July 31, 2000
- **Article:** TA29594

- **Old Article:** 12498

This article has been archived and is no longer updated by Apple.

This article covers two items which can be done to the configuration of an AS/400 which will improve the performance of SNA*ps 5250 and DAL for The AS/400.

AS/400 Process Overview

To understand these configuration changes, it is helpful to review how these products are connected externally and internally with the AS/400. Both SNA*ps 5250 and DAL use APPC sessions which are Prebound-Contention Winners that are provided through a SNA*ps Gateway connection. The physical connection to the AS/400 is via a Token Ring or SDLC line attachment. Since this is an APPC connection and the SNA*ps gateway is in a Peer-to-Peer relationship, the Macintosh client applications make a call to a transaction program which is available on the AS/400. SNA*ps 5250 calls the Display-Station Passthru program while DAL for the AS/400 calls the DALSERVER.

The AS/400 is divided up into subsystems which receive and manage work for the system and users. The major subsystems are QBATCH, QINTER and QCMN. QBATCH manages all batch processing jobs running in the AS/400. The QINTER subsystem is used by all interactive jobs such as terminal emulation and print emulation. When SNA*ps 5250 is logged onto the AS/400, an interactive job is running in the QINTER subsystem. The QCMN subsystem is used by the APPC connections to the AS/400. These include DAL for the AS/400, SNA*ps 5250, and PC Support (for IBM PCs). Any client application which makes a program call via an APPC link, has to first be managed by QCMN and have a job assigned to the process.

When SNA*ps 5250 requests the Display Station Passthru request to the AS/400, QCMN deals with the request. Once the user logs on the AS/400, a second job is started in the QINTER subsystem which manages that part of the user process. So with SNA*ps 5250, there are two AS/400 jobs running, one in QCMN for APPC and one in QINTER for the interactive terminal process.

When DAL for the AS/400 requests a connection to the AS/400, a call to the DALSERVER is made and the QCMN subsystem manages the entire job. The DAL client user logs on to the DALSERVER using AS/400 security for validation but a DAL session is always an APPC session on the AS/400 and does not create a second interactive job to support the process like SNA*ps 5250.

So you can see the QCMN subsystem is very important to the operation and performance of both DAL and SNA*ps 5250. There are two entries in the QCMN subsystem which can be altered to better optimize performance: routing entries and prestart job entries.

Based on how QCMN is configured for routing entries, a Class gets assigned to the process. A class contains parameters that control the running of a routing step. The Class defines the overall Run Priority of the job in the AS/400. The rating for Run Priority ranges from 1 (very high availability of the AS/400 resources to the job) to 99 (very low availability of AS/400 resources to the job). The Class also defines the Time Slice of the AS/400 that is assigned to the job. Time Slice is defined as a maximum amount of processor time, in milliseconds, given to the job before other jobs are given the opportunity to run. The time slice establishes the amount of time needed by the job to accomplish a meaningful amount of processing. At the end of the time slice, the job might be put in an inactive condition so that other jobs can become active. The larger that Time Slice value, the more processor time can be assigned to the job before other jobs step in. The range of Time Slice is 1000 to 10,000 milliseconds.

The Prestart job entries allow the QCMN subsystem to be prepared to run a large program, such as, the DALSERVER. A Prestart job can have

a Class with a higher Run Priority than the default values given the routing entries in the Subsystem.

Changing Routing Entries Details For SNA*ps 5250

QCMN Routing Entries

If a DSPSBSD AS/400 command is done for the QCMN subsystem, the following screen appears:

Subsystem description: QCMN Library: QSYS
Status: ACTIVE

Select one of the following:

1. Operational attributes
2. Pool definitions
3. Autostart job entries
4. Work station name entries
5. Work station type entries
6. Job queue entries
7. Routing entries
8. Communications entries
9. Remote location name entries
10. Prestart job entries

* Select option 7, Routing Entries:

```
>>>>>>>>>>>>>>>>>>>>>>>>>
                                                          Start
Opt    Seq Nbr    Program       Library       Compare Value          Pos
         50      *RTGDTA                     'QVPPRINT'             37
        100      *RTGDTA                     'QTFDWNLD'             37
        150      *RTGDTA                     'QMFRCVR'              37
        180      *RTGDTA                     'QPAPAS'               37
        200      *RTGDTA                     'QMFSNDR'              37
        210      *RTGDTA                     'QHQTRGT'              37
        220      *RTGDTA                     'QRQSRV'               37
        230      *RTGDTA                     'QPCSUPP'              37
        250      *RTGDTA                     'QCNPCSUP'             37
        275      *RTGDTA                     '#INTER'                1
        300      *RTGDTA                     'PGMEVOKE'             29
325 *RTGDTA 'QPCSUPP' 1
350 *RTGDTA 'RSCLIB47' 1

>>>>>>>>>>>>>>>>>>>>>>>>>
```

The Sequence numbers are in order of system searches for a match in the program call to the subsystem. The program call is in the form of a call record which is character start position oriented. The word PGMEVOKE always appears starting in column position 29 followed by the actual name of the program in start position 37. The routing entries shown above have
two entries which are found in OS/400 V2R2M0 and important to SNA*ps and DAL. Sequence number 300 is a generalized matching entry, supplied by IBM, for any PGMEVOKE with a name that does not match any of the specific names found starting in position 37. The routing entry with sequence number 180 was added to catch the Display Station Passthru call from SNA*ps 5250 to the QCMN subsystem. Before the addition of sequence 180, the call was routed based on the entry with sequence number 300. Lets look at the differences between these two entries.

Sequence number 300:

Routing entry sequence number . . . . . : 300
Program . . . . . : *RTGDTA
Library . . . . . :
Class . . . . . : QBATCH
Library . . . . . : QGPL
Maximum active routing steps . . . . . : *NOMAX
Pool identifier . . . . . : 1
Compare value . . . . . : 'PGMEVOKE'

Compare start position . . . . . : 29

The Class for this entry is QBATCH which is IBM supplied and has a Run Priority of 50. The Time Slice is 5000 milliseconds. This is lower than

any PC Support process which runs with Priority 20.

Now lets look at the Sequence number 180 entry:

Routing entry sequence number . . . . . : 180
Program . . . . . : *RTGDTA
Library . . . . . :
Class . . . . . : QWCPCSUP
Library . . . . . : QGPL
Maximum active routing steps . . . . . : *NOMAX
Pool identifier . . . . . : 1
Compare value . . . . . : 'QPAPAS'

Compare start position . . . . . : 37

The Class for this entry is QWCPCSUP which is IBM supplied and has a Run Priority of 20. This is the same as that of any PC Support process and places the SNA*ps 5250 workstation function at the same performance threshold as PC Support. The Time Slice is 500 milliseconds which is adequate for interactive sessions like SNA*ps 5250.

If the SNA*ps 5250 program call is made to a standard set of entries in QCMN, the results would be to use the QBATCH Class which would perform slower than a PC Support WorkStation Function emulation.

If the user logs on to the AS/400, then a job starts in the Interactive Subsystem or QINTER. All jobs managed by the QINTER subsystem use the QINTER Class. This Class has a Run Priority of 20 and a Time Slice of 2000 milliseconds. From this we can see that a SNA*ps 5250 connection will be running with priority 20 in the QINTER subsystem but then have to wait, on a busy machine, for time to complete the data transfer through the QCMN subsystem since it has a priority of 50 there. PC Support 5250 sessions do not have this delay since both jobs running on their behalf have priority of 20. (Remember 20 is better than 50.)

How to add the Routing entry to QCMN subsystem for SNA*ps 5250:

In order to configure the QCMN routing entries to improve performance on heavily loaded machines do the following steps. Log on as QSYSOPR or QSECOFR. Be sure all users on the QCMN subsystem have been warned with a broadcast message that the subsystem will be going down and all passthru sessions will be terminated. Stop the QCMN subsystem at the AS/400 console. Enter the following command on the command line:

ADDRTGE SBSD(QCMN) SEQNBR(180) CMPVAL(QPAPAS 37) PGM(*RTGDTA) CLS(QWCPCSUP)

The Sequence number has to be a number which is not currently in use by the subsystem. The compare value is the name QPAPAS which is the name of the Passthru program in the PGMEVOKE call. The class QWCPCSUP is an IBM supplied Class with Run Priority of 20. However, a new Class could be configured with a different Run Priority than 20 but this is not really necessary.

Changing Routing Entries For DAL For The AS/400
The DAL Server call is made to the routing entries of the QCMN subsystem just like the SNA*ps 5250 Passthru call. The DAL call is routed through the generalized PGMEVOKE 29 location and acquires the Class of that routing entry. The IBM default for this routing entry is QBATCH Class which has Run Priority 50. If DAL is compared with a PC Support connection (Run
Priority 20 which is higher and therefore providing better service), DAL will come out slower that any PC Support driven process. One fix is to change the Class of the PGMEVOKE 29 routing entry to something with a Run Priority of 20. This may not be the best solution for the overall AS/400 since all program calls which are only qualified by PGMEVOKE will be given an interactive process Run Priority. DAL as an interactive process should be running with at least a Run Priority of 20.

Adding A Prestart Job For DAL In Subsystem QCMN

As an alternative to altering the Class of the PGMEVOKE 29 routing entry, it makes more sense to define a new Class, like DALCLS and define a Run Priority and Time Slice that makes sense. Use the CRTCLS AS/400 command and a Prompt Key and use the following as an example:

```
>>>>>>>>>>>>>>>>>>>

                        Display Class Information
                                                       System:  APPLE SR
Class . . . . . :   DALCLS
  Library . . . . . :     QGPL
Run priority  . . . . . :   20
Time slice in milliseconds  . . . . . :   3000
Eligible for purge  . . . . . :   *YES
Default wait time in seconds  . . . . . :   30
Maximum CPU time in milliseconds  . . . . . :   *NOMAX
Maximum temporary storage in K bytes  . . . . . :   *NOMAX
Text  . . . . . :   Class for DALServer
```

```
>>>>>>>>>>>>>>>>>>>>
```

Notice the Run Priority of 20 (more like interactive) and Time Slice of 3000 milliseconds (more like a batch process).

Next, a Prestart Job should be added to the QCMN Subsystem. Enter an ADDPJE command on the AS/400 and the Prompt Key. The example below should be used as a template to fill in the screen:

```
>>>>>>>>>>>>>>>>>>>>
```

```
                    Display Prestart Job Entry Detail
                                                        System:  APPLE SR
Subsystem description:   QCMN           Status:   ACTIVE

Program  . . . . . . . . . . . . . . . . . . . . . :   DALSERVER
 Library  . . . . . . . . . . . . . . . . . . . . . :     DALLIB
User profile . . . . . . . . . . . . . . . . . . . . :   QUSER
Job  . . . . . . . . . . . . . . . . . . . . . . . . :   DALSERVER
Job description  . . . . . . . . . . . . . . . . . . :   *USRPRF
 Library  . . . . . . . . . . . . . . . . . . . . . :
Start jobs . . . . . . . . . . . . . . . . . . . . . :   *YES
Initial number of jobs . . . . . . . . . . . . . . . :   3
Threshold  . . . . . . . . . . . . . . . . . . . . . :   2
Additional number of jobs  . . . . . . . . . . . . . :   2
Maximum number of jobs . . . . . . . . . . . . . . . :   *NOMAX
Maximum number of uses . . . . . . . . . . . . . . . :   200
Wait for job . . . . . . . . . . . . . . . . . . . . :   *YES
Pool identifier  . . . . . . . . . . . . . . . . . . :   1
Class  . . . . . . . . . . . . . . . . . . . . . . . :   DALCLS
 Library  . . . . . . . . . . . . . . . . . . . . . :     QGPL
 Number of jobs to use class  . . . . . . . . . . . :     *CALC
Class  . . . . . . . . . . . . . . . . . . . . . . . :   *NONE
 Library  . . . . . . . . . . . . . . . . . . . . . :
 Number of jobs to use class  . . . . . . . . . . . :     *CALC
```

```
>>>>>>>>>>>>>>>>>>>>
```

The most important entries on this screen are:

1) Program name - DALSERVER
2) Library Name - DALLIB is the DAL install default
3) Initial number of Jobs should be kept at the default of 3
4) The Additional number of Jobs should be kept at 2 which is the value used to determine how many additional jobs to start after the initial number are started and used.
5) Maximum number of jobs stays at *NOMAX
6) The Class should be DALCLS which is in library QGPL. This is the Class we just created for the DALSERVER and it will be used with the Prestart Job entry in Subsystem QCMN.

When the DAL process starts now, it will start faster and have a Run Priority of 20 which will place it on the same level as PC Support and Showcase VISTA, an AS/400 database query tool, which is competing with DAL.

Let's test this enhancement for DAL. If we connect a DAL client to the AS/400 and then do a WRKACTJOB on the AS/400, we see that a job has been started for the DALSERVER as a PJ (Prestart Job) in Subsystem QCMN.

```
>>>>>>>>>>>>>>>>>>>>
```

```
Opt  Subsystem/Job  User        Type  CPU %  Function        Status
    QBATCH         QSYS        SBS      .0                 DEQW
    QCMN           QSYS        SBS      .0                 DEQW
      DALSERVER    QUSER       PJ       .0                 CPCW  <<<DAL
      TKNAXTC      XCOM        EVK      .0  *  -PASSTHRU    EVTW
    QCTL           QSYS        SBS      .0                 DEQW
      QSYSSCD      QPGMR       BCH      .0  PGM-QEZSCNEP    EVTW
    QINTER         QSYS        SBS      .0                 DEQW
      QPADEV02     QSECOFR     INT      .0  CMD-WRKACTJOB   RUN
    QSPL           QSYS        SBS      .0                 DEQW
```

```
>>>>>>>>>>>>>>>>>>>>
```

If we work with the details for DALSERVER connection (option 5) and then display the run attributes of the Job (option 3), we see that the DALSERVER now has the Class privileges of DALCLS (RP of 20 and TS of 3000 ms):

```
>>>>>>>>>>>>>>>>>>>>
```

```
Job:   DALSERVER      User:   QUSER          Number:   019163
```

```
Run priority  . . . . . . . . . . . . . . . . . . . :   20
Time slice in milliseconds  . . . . . . . . . . . . :   3000
Eligible for purge  . . . . . . . . . . . . . . . . :   *YES
Default wait time in seconds  . . . . . . . . . . . :   30
Maximum CPU time in milliseconds  . . . . . . . . . :   *NOMAX
 CPU time used . . . . . . . . . . . . . . . . . . . :    5335
Maximum temporary storage in K bytes  . . . . . . . :   *NOMAX
 Temporary storage used  . . . . . . . . . . . . . . :    6

>>>>>>>>>>>>>>>>>>>
```

Another DAL For AS/400 Performance Enhancement
It is possible to place the DALSERVER in AS/400 main storage and have it load more quickly at program start time and perhaps program execution time depending on the available RAM space in the selected pool. The AS/400 command is SETOBJACC (Set Object Access). The function of SETOBJACC is shown below from the AS/400 help screen on this command.

The Set Object Access (SETOBJACC) command temporarily changes the speed of access to an object by bringing the object into a main storage pool or purging it from all main storage pools. An object can be kept main storage resident by selecting a pool for the object that has available space and does not have jobs associated with it. Repeated use of the command can cause a set of objects to be resident in a main storage pool.

The command entry screen for SETOBJACC is shown below filled in with the default DAL values.

```
>>>>>>>>>>>>>>>>>>>
                        Set Object Access (SETOBJACC)

Type choices, press Enter.

Object . . . . . . . . . . . . . . > DALSERVER     Name
  Library  . . . . . . . . . . . . >   DALLIB      Name, *LIBL, *USRLIBL...
Object type  . . . . . . . . . . . > *PGM          *FILE, *PGM
Storage pool:
  Shared pool or subsystem name  . > *BASE         Name, *JOB, *BASE...
  Pool identifier  . . . . . . . . > 2            1-10

>>>>>>>>>>>>>>>>>>>
```

After this command has been done the following appears on line 25 of the 5250 screen:

"3K of DALSERVER brought to pool with 9K unused".

The DALSERVER is now launched by the AS/400 as quickly as possible. It is a Prestart Job in the QCMN subsystem and it is resident in a Main Storage pool. These suggestions should enhance DAL for AS/400 performance on very busy or smaller AS/400s (9402 and 9404 models).

Macintosh PC Exchange 1.0.3: Using with Other Applications

- **Last Modified:** July 02, 1993
- **Article:** TA29601
- **Old Article:** 12505

Article Created: 1 July 1993

Macintosh PC Exchange lets you use PC-formatted floppy disks on your Macintosh. It lets you transfer files between a Macintosh and a PC-compatible computer by copying the files to and from a floppy disk. This article tells you what you need to install Macintosh PC Exchange 1.0.3, and to use it with other types of programs.

What You Need to Install Macintosh PC Exchange

To use Macintosh PC Exchange, you must have Macintosh system software version 7.0 or later. Macintosh PC Exchange doesn't work with system software version 6.

If you've already installed another PC disk mounting utility in your Macintosh, be sure to remove it before installing Macintosh PC Exchange. Then drag the PC Exchange icon into the Control Panels folder of your System Folder, and restart the Macintosh.

Notes on Using Macintosh PC Exchange

If you change the name of a PC-format disk to a name that's longer than 11 characters, the disk name will be truncated when you view it on a PC-compatible computer.

If Macintosh PC Exchange encounters a problem while formatting a disk, an Updating Disk... dialog may appear. This dialog includes a progress bar that shows the status of the updating process. To stop the disk from being updated, click the Cancel button. This cancels the initialization process, and the disk ejects from the disk drive.

In the PC Exchange control panel, you can't create an assignment with a blank DOS suffix.

Sometimes a Macintosh application program can't interpret the file format of a PC document. When this happens, the document's formatting displays incorrectly, and you may see strange characters in the document. When this happens, try using another application, or translate the document into a different file format using one of the file format translation utilities available for the Macintosh (like MacLinkPlus Translators from DataViz).

Paint Programs

Some paint programs, like MacPaint and SuperPaint, save documents onto PC-format disks very slowly. To get around this, always save paint documents onto your computer's hard disk. If you like, you can then copy the document onto a PC-format floppy disk.

ClarisWorks Version 1.0v2 or Earlier

Some versions of ClarisWorks can't read or write files on PC-format disks. To open a PC document in ClarisWorks, you must first copy the document onto the hard disk. Always save ClarisWorks documents onto your hard disk. Contact Claris to obtain version 1.0v3 or later.

AutoDoubler

To use AutoDoubler with Macintosh PC Exchange, you must first open the AutoDoubler control panel and remove the X from the box labeled "Show DD on Compressed Files."

Directory Assistance II

You shouldn't use this program while the Macintosh PC Exchange control panel is open. You can turn off Directory Assistance II from the PC Exchange control panel by holding down the Option key while you click the Add or Change buttons in the control panel window. Using the PC Exchange control panel temporarily disables Directory Assistance, and closing the PC Exchange control panel automatically enables it.

Opening MS-DOS documents using Macintosh PC Exchange (7/93)

- **Last Modified:** July 12, 1993
- **Article:** TA29632

- **Old Article:** 12553

Article Created: 7 July 1993

This article describes how to designate a specific Macintosh application for opening MS-DOS documents by the extension following its file name.

Double-clicking an MS-DOS or Windows file like you would a Macintosh file at the Finder level usually doesn't result in the file opening. This is because the document doesn't know which Macintosh application to use. By using the PC Exchange control panel you can assign certain MS-DOS files to certain applications. This is done in the PC Exchange control panel window.

1) Open the PC Exchange control panel located in the Control Panel folder in your System Folder.

2) Click on Add.

3) Type in a period and the three letter extension, for example .TXT.

4) Select which Macintosh application is to be assigned that file type.

So that all members of a Network are consistent, make a master list of assignments on one Macintosh and place a copy of the PC Exchange Preferences folder in the Preferences folder of each licensed user of Macintosh PC Exchange.

System 7.x: Can‘t Rename HD & Custom Icons, Shared Items (9/94)

I can't rename the hard disk on my Macintosh running System 7 or System 7.0.1; or I changed the Macintosh hard disk icon to a custom icon. I chose "Get Info" under the Finder's File menu and pasted in another icon. I couldn't clear or change back to the original icon.

What causes this and what can be done to fix it other than completely reinitializing the hard disk?

This article has been archived and is no longer updated by Apple.
First ensure that you aren't running File Sharing, and you don't have the hard drive shared. Even if you do not set the sharing permissions for a particular volume, File Sharing still makes all volumes available to the owner for remote access. To change the name of a mounted volume, turn File Sharing off with the Sharing Setup Control Panel, rename the disk, then turning File Sharing back on again.

If an AppleShare File or Print Server software is running and you can't change the name of a mounted volume, then quit the sever software, rename the disk, then start the server software again.

If File Sharing or AppleShare Server software is not on, then the problem is with versions of System 7 prior to 7.0.1 where volume names and icons sometimes can't be changed. If you are a System 7.0 user and are having trouble renaming your hard disk or a folder, you may need Rename Rescue. The problem was corrected in System 7.0.1 and later.

What It Is

Rename Rescue is a small application that unlocks the name of folders and volumes.

How To Use It

If file sharing or AppleShare server software is on, turn it off.

From the Finder, select the items that need to be unlocked and drag them onto the Rename Rescue icon. You may select one or many items at a time. The Finder will automatically highlight Rename Rescue's icon. If Rename Rescue was not already started, it will open at this time, attempt to unlock, present a dialog for each item reporting the results. It will then automatically quit.

The possible results are:

* The item can not be renamed because it is being shared.
* The item can not be renamed because it is a System reserved folder.
* The item was already renameable.
* The item is now renameable.

After Rename Rescue unlocks the items, you should restart your Macintosh so the Finder will recognize the change.

Technical Information (how folders get locked in the first place)

The names of folders or volumes may get inadvertently locked on a computer running System 7.0. For this to happen, several things must occur. Unless all of these things have occurred, you will probably not need Rename Rescue.

* The volume or folder is (or was) used on a drive connected to a computer running System 7.0 (the problem is corrected in System 7.0.1 and newer).
* The volume or folder was shared with a computer running System 6.x (all versions of System 6) and the connection was unexpectedly interrupted (power failure, crash, or improper shutdown).
* Upon restart, the volume and/or folder on the System 7.0 computer may not renameable.

To get Rename Rescue, search on one of the following articles:

Chinese System Software: File Encoding Method

- **Last Modified:** May 09, 2000
- **Article:** TA29701

- **Old Article:** 12634

What character encoding method is used for simplified Chinese in WorldScript? The two common encoding types are GB and Big 5. Which one does Apple uses, or has Apple developed it's own.
The character encoding methods used for Traditional and Simplified versions of Chinese System Software for WorldScript are BIG 5 and GB respectively. BIG 5 is used for Traditional Chinese system software, and GB used for Simplified Chinese system software.

Performa 450: Converting DOS Files to WP Works (7/93)

- **Last Modified:** May 24, 1995
- **Article:** TA29711

- **Old Article:** 12654

Article Created: 20 July 1993

I have a Performa 450 with WordPerfect Works and PC Exchange already installed. I have been trying unsuccessfully to convert a DOS Word file (.DOT) into WordPerfect Works. Can I convert this file?

Products Affected

Windows OS

WordPerfect Works can only work with a limited number of MS-DOS files. The .DOT file is probably not one of them.

Here are some suggestions for you to try:

* Try loading it back into the DOS application and trying to save as Text Only, Microsoft Word, WordPerfect, or any other common file format.

* Ask your local dealer about products that work in conjunction with PC Exchange and actually translate documents into various types of Macintosh files. Some of them have several different translators that your WordPerfect Works application does not have.

Performa: Kensington System Saver

- **Last Modified:** June 07, 1999
- **Article:** TA29715

- **Old Article:** 12658

This article has been archived and is no longer updated by Apple.
I recently replaced my Apple IIgs with a Macintosh Performa 405. On my IIgs I used a Kensington System Saver. Can I use the Kensington System Saver with the Performa?
Kensington doesn't recommend using this unit on a Macintosh computer. The System Saver was designed to add a fan and surge protection to the Apple IIgs. The Performa 405 has a fan built-in and therefore requires no additional fan. You can purchase a surge protector from most hardware stores and have all the features the System Saver afforded.

Kensington also offered a System Saver for the compact Macintosh computers such as the 128, 512K, 512KE, SE, Plus, SE/30, Classic, Classic II and Performa 200. As with the System Saver for the Apple IIgs, this System Saver will not fit on the Performa 405 or Macintosh LC computers.

Playback Quality of 16-bit Audio on Macintosh Hardware (1/96)

I mounted an audio compact disc and converted one of the tracks to a QuickTime movie sound file using 44.1KHz, 16-bit, Stereo settings in MoviePlayer's Open/Convert/ Options dialog. When I listened over headphones connected to the computer, the playback of the file through MoviePlayer had a hiss or background noise. When I played the track from MoviePlayer before it was converted (the option screen has a play selection) the sound file had the same background noise. However, when I played the same CD track through CD Remote with headphones connected directly to the CD player the sound was great and there was no background noise.

Why is there noise when playing back from MoviePlayer? Shouldn't the playback be equal to the original?

This article has been archived and is no longer updated by Apple.

The reason for the apparent noise in the playback is due to the lack of 16-bit 44.1KHz audio playback hardware on some Macintosh computers. Using the file settings you indicated, the file will be an identical copy of what is on the audio CD. The QuickTime movie file on disk is a full CD-quality 16-bit, 44.1KHz, stereo sound file. However, to enjoy the full clarity of this file, your Macintosh computer must be capable of 16-bit, 44.1KHz sound output. Starting with the original AV computers released in July 1993, most subsequently released Macintosh computers have 16-bit sound capability. The Power Macintosh 5200, 5300, 6200, and 6300 series computers have 16-bit sound out capability but only at 22.05KHz. You can use this procedure below to determine if your computer supports 16-bit sound:

Step 1

Choose Control Panels from your Apple menu.

Step 2

Open the Sound control panel.

Step 3

Choose "Sound Out" from the "Alert Sounds" pull down menu. If the 16-bit sound radio button is grayed out, you only have 8-bit sound capabilities.

If 16-bit is not grayed out, make sure there is a dot in the radio button next to it.

Step 4

Use the close box in the upper left corner to close the Sound control panel.

Older Macintosh computers that do not support 16-bit sound can be made 16-bit capable by adding an audio card like Digidesign's AudioMedia II card. To use a 16-bit audio card like this will require Sound Manager 3.x and a Sound Manager component (driver) for the card. The driver component will be supplied by the card manufacturer.

Creating a sound file from the audio disc using the method described is actually a file transfer from the audio disc to the Macintosh hard disk. Thus, there is no conversion of the digital audio to analog audio when transferring the track from the audio disc to the hard disk. By keeping the audio track in the digital domain, it is possible to make an identical copy. Using the 44.1KHz, 16-bit, Stereo options provides that identical copy. The reason noise is introduced when playing back the sound through your computer is the limit of the of 8-bit sound only Macintosh audio hardware.

What happens to the recorded sound on 8-bit only sound capable computers

---

When playing back the sound without 16-bit hardware, the Sound Manager must throw away half of the bits in the audio samples and playback only half of the samples that exist. Thus, the actual data being used is only 25% of the original file.

The reason only 25% of the original data is used is because 8-bit sound Macintosh computers only sample at 22.05KHz. Therefore, the 16-bits must be reduced to 8-bits; and the 44.1KHz must be reduced to 22.05KHz. The Sound Manager accomplishes this "dithering" (known as "downsampling") of the sound - much like QuickDraw dithers a 24-bit color image into an 8-bit color image.

As a side note: Sound Manager 3.x uses a more sophisticated method of downsampling than Sound Manager 2.0. This improves the playback quality of the 16-bit, 44.1KHz sound file on an 8-bit, 22.05KHz system; although, it does not come close to playing back the full 16-bit, 44.1KHz recording.

Digital audio engineers would not usually use "noise" to describe what is happening to the sound. It is more correctly called quantization distortion. Unless you are discussing this issue with a digital audio engineer, "noise" is an acceptable phrase - that is, after all, what it sounds like to the your ear.

In digital audio the main measurement of maximum expressible amplitude to error ratio is called Signal-to-Error (S/E) ratio. This expressible amplitude is also referred to as the "maximum signal" of the recorded sound. The error is what is perceived as noise. The S/E ratio specification of a digital system is closely related to the Signal-to-Noise (S/N) ratio of an analog system, although it is not identical in nature due to differences between digital and analog methods.

The S/E ratio can be expressed specifically by calculating first a maximum signal value, second an error value, and finally creating their ratio. Although there are intervening steps in the math, the final formula to use when calculating the strength of the audio signal above the noise (distortion or error) level looks like this:

```
6.02 * n + 1.76 dB
```

Where n is equal to the number of bits in the sample. The following results are approximate signal above noise ratios for a various number of bits in a sample. Generally, the calculated results will be slightly higher than the measured results. Also, specific implementations of hardware will affect the actual measured ratios in a downward fashion.

```
16-bit samples (number in CD audio)  = 98 dB

12-bit samples                       = 86 dB

 8-bit samples (Macintosh sound)     = 48 dB
```

To relate the quality of these digital recordings to analog recordings, think of the 8-bit recordings as inexpensive cassette recorders with inexpensive tape. The 12-bit recordings correlate to high quality cassette recorders with noise reduction and metal tape. The 16-bit recordings equate to professional studio reel-to-reel tape recorders with noise reduction and professional tape at high tape speeds.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Article Change History:

31 Jan 1996 - Added 8-bit and 16-bit computer information.

26 Jan 1996 - Made minor technical and formatting changes.

Additional Product Support Information

Macintosh AV Series: Monitor Support

This article provides information on monitors supported on the Quadra 840AV, Quadra 660AV, and Centris 660AV and on how two frame buffers are used to support both computer graphics and video.
This article has been archived and is no longer updated by Apple.

Frame Buffers

The members of the Macintosh AV Series are the first Macintosh computers to use two different frame buffers. These are the graphics frame buffer, and the video frame buffer. VRAM can be used in two different ways, either used completely by the graphics frame buffer (standard Macintosh display), or split 50/50 between the graphics frame buffer and the video frame buffer.

To achieve the highest graphics bit depth, the two frame buffers are often used together for graphics. Consequently, video-in is not available when displaying graphics at the highest bit depth for many monitors. When displaying live video, the two frame buffers are merged so the video-input appears as a window on the graphics display.

For example, a Quadra 840AV with 2MB of VRAM can support a 14-inch color monitor at 24-bits in a strictly graphic environment or can provide support for a 16-bit graphics window and a 16-bit video window.

VRAM & Bit Depth

The Quadra 840AV and Centris 660AV come standard with 1 MB VRAM. The Quadra 840AV is expandable to 2 MB VRAM. Upgrading the Quadra 840AV's VRAM to 2 MB permits 24 bit display (millions of colors) on monitors up to 16 inches and 16 bit (thousands of colors) on the 21-inch color monitor.

The machines can drive an NTSC or PAL monitor directly, without the use of an encoder box. In order for that feature to be enabled, the display resolution should be either 512x384 or 640x480 for NTSC, or 640x480 or 768x576 for PAL. Hence the different resolutions available for each display.

Notes:
1) The Macintosh Centris 660AV always has 1 MB of VRAM.

2) The Macintosh Quadra 840AV comes standard with 1 MB of VRAM and may be expanded to 2 MB of VRAM. Four 80 ns (nanosecond) 256K VRAM SIMMs are required.

3) Where multiple resolutions are available, an asterisk (*) indicates the standard resolution. Additional resolutions allow you to display more colors by only using a portion of the monitor. Select the resolution by using the Options dialog of the Monitors Control Panel. You must reboot to change resolutions. The size of the pixels will not change in these alternate modes. Instead, a black border will appear around the smaller active video area.

4) A "Flicker-free" mode (sometimes referred to as Apple Convolution) is available when displaying on a TV. This mode is available at up to 8 bits/pixel and is not available when using video-in.

5) bpp is Bits Per Pixel. A range is given in table below, indicating which of the following are available:

1 bpp - Black & White
2 bpp - 4 colors or greys
4 bpp - 16 colors or greys
8 bpp - 256 colors or greys (greys only for Video in)
16 bpp - Thousands of colors (5 bits each of R, G, and B)
32 (24 plus 8) bpp - Millions of colors (8 bits each of R, G, and B)

6) The maximum visible number of colors is millions. In the past, Apple has labeled this as 24 bit color. However, 24 bpp or 32 bpp are interchangeably used to mean support for millions of colors. When you see 32 bpp listed on the chart below, think 24 plus 8: 24 bpp for displaying millions of colors plus 8 bpp for special uses, such as alpha channel support and chroma key support.

7) Both the video and graphics portions of VRAM are often used together to display graphics at the highest available bit depth. In the table below, the range of graphics bit depths is marked with # when video-in is available at the maximum graphics bit depth. In all other cases video-in is not available when using the highest graphics bit depth.

		1 MByte VRAM	2 MByte VRAM

Display	Resolution	Graphics bpp	Video-in bpp	Graphics bpp	Video-in bpp
12-inch RGB	512 x 384*	1-32	8-16	1-32	8-16
	560 x 384	1-32	8-16	1-32	8-16
13-inch, 14-inch RGB & 12-inch Monochrome	512 x 384	1-32	8-16	1-32	8-16
	640 x 400	1-32	8-16	1-32	8-16
	640 x 480*	1-16	8-16	1-32	8-16

Digital Signal Processor (DSP) - Overview

This article gives a overview of the Digital Signal Processor (DSP) chip which is a part of the Macintosh Centris 660AV and Quadra 840AV computers.
This article has been archived and is no longer updated by Apple.
The Quadra 840AV and Centris 660AV are the first Macintosh computers that include a Digital Signal Processor (DSP) chip integrated on the logic board.

Apple uses an AT&T DSP3210 chip for both models, the only difference being the clock frequency which is 55 Mhz on Centris 660AV and 66.7 Mhz on the Quadra 840AV.

The DSP implementation on the Quadra 840AV and Centris 660AV uses it's own multitasking operating system (the Apple Real-Time Architecture or ARTA) but shares the same memory as the host CPU, the 68040. The Quadra 840AV and Centris 660AV are truly dual processor Macintosh computers, as both the 68040 and the DSP have equal access to system resources.

The DSP on the Quadra 840AV and Centris 660AV is primarily responsible for performing real time processing of tasks such as speech recognition, sound, analog modem signal processing, or any other time-correlated data. The DSP can also be programmed to perform non real-time (also called timeshare) tasks such as image processing.

Real-Time versus Timeshare Processing

The difference between real-time and timeshare processing is that real-time tasks such as speech recognition requires guaranteed processing bandwidth.

Timeshare tasks are processes that don't involve a time dependency such as image manipulation or number crunching. Timeshare tasks are processed whenever there is excess DSP bandwidth not being used by a real-time process.

Please note that real-time tasks will not necessarily execute faster than timeshare tasks. In many cases, timeshare tasks will get more of the processing bandwidth and will complete sooner than real-time tasks. Real-time refers to tasks that need a specific amount of data to be processed during a specific amount of time.

Sound Manager 3.0, Speed Recognition API, and the Communication Toolbox utilize the DSP, but for an application to do more than sound, telecommunications, and speech recognition, it will have to be specifically written to use the Apple Real-Time Architecture manager.

Centris 660AV & Quadra 840AV: 2MB ROM Information

This article provides information on the new 2MB ROM in the Centris 660AV and Quadra 840AV.
This article has been archived and is no longer updated by Apple.
The Centris 660AV and Quadra 840AV are the first Macintosh computers to implement a 2MB ROM using two 512Kx16 chips. The new ROM is also the first ROM that contains code for portions of System 7 that were able to be moved to the ROM, freeing up RAM for applications and other system use.

The ROM has also been vectorized which allows for easier System patch creation and from a development perspective is much easier to maintain.

The new ROM also includes:

* Support for the Digital Signal Processor (DSP)
* New drivers for DMA based LocalTalk, Ethernet, Floppy disk, and SCSI
* QuickTime 1.5*
* Sound Manager 3.0
* Video input and output driver
* Speech recognition and text to speech driver

* Apple Events and AppleScript
* Software support for telecom capabilities
* QuickTime 1.5 is installed in ROM, however, the software version of QuickTime 1.6 was installed at the factory and will override the version in ROM.

Macintosh AV Series: Video Features and Subsystems

- **Last Modified:** October 04, 2008
- **Article:** TA29779

- **Old Article:** 12738

This article has been archived and is no longer updated by Apple.
This article describes the video features of the Macintosh AV Series computers and their video subsystem.
New Video Features of the Macintosh AV Series

Composite and S-video output is supported directly from the logic board. This allows the Centris 660AV, Quadra 660AV and Quadra 840AV to connect directly to presentation equipment, televisions, or a VCR. NTSC and PAL video formats are supported.

Video and graphic acceleration and manipulation is enhanced by the inclusion of a new Digital Audio Visual (DAV) connector. This permits NuBus cards that have DAV connectors to manipulate audio and video signal directly from the main logic board.

Composite and S-video input can be connected directly to the Centris 660AV, Quadra 660AV and Quadra 840AV and can display and process this information in a separate video window. NTSC, PAL, and SECAM formats are supported.

Video Subsystem

DAV

The Digital Audio Video (DAV) connector is a 40 pin DAV connector that lines up with one of the NuBus slots in the Quadra 840AV. It is included as an option when customers purchase the NuBus adapter card for the Centris 660AV and Quadra 660AV. This connector provides access to the video input signals directly from the logic board in a YUV 4:2:2 format and to the digital audio signal input for the Singer CODEC.

This connector allows 3rd party NuBus card developers to access components on the 840AV logic board for audio and video compression, which eliminates the need for redundant components on the card and allows the customer the choice of compression technologies : e.g., MPEG, JPEG, DVI, or H.261 (videoconferencing).

Macintosh Universal NuBus Interface (MUNI)

Supports the full range of NuBus master/slave transactions with single or block moves, including dumps and runs in which the main processor is master and the NuBus is slave , supports faster data transfer rates to and from the CPU bus, and supports NuBus 90 data transfers between cards at a clock rate of 20 MHz.

NOTE: the MUNI is located on the main logic board in the Quadra 840AV and on the optional NuBus adapter card for the Centris 660AV and Quadra 660AV.

Two different Frame Buffers

The Macintosh AV Series computers are the first Macintosh computers to use two different frame buffers. These are the graphics frame buffer, and the video frame buffer. VRAM can be used in two different ways, either used completely by the graphics frame buffer (standard Macintosh display), or split 50/50 between the graphics frame buffer and the video frame buffer.

For example, A Quadra 840AV with 2MB of VRAM can support a 14-inch color monitor at 24-bits in a strictly graphic environment or can provide support for a 16-bit graphics window and a 16-bit video window.

The video subsystem digitizes video input and coverts the image to YUV format which is available at the Digital Audio/Video expansion adapter (DAV Connector). This provides expansion for our third party developers to develop NuBus cards for video compression and decompression, acceleration, image enhancements, etc.

Cyclone Integrated Video Interface Controller (CIVIC)

Manages VRAM; controls data transfer between VRAM, the VDC and Sebastian; provides 32-bit or 64-bit data paths between VRAM and the main processor or aslot card; peforms convolution; provides needed video timing signals; and generates the vertical blanking and video- in interrupt signals.

Video Data Path Chip (VDC)

Performs input video window scaling with horizontal and vertical filtering, accepts YUV 4:2:2 color-encoded input from the Digital Multistandard Decoder or the DAV slot card bus, and produces 16-bit 1:5:5:5 RGB, 8-bit grayscale, or YUV 4:2:2 output.

Sebastian

Sebastian - A video color palette and video digital-to-analog converter (DAC). It accepts up to 64 bits of digital input, either as one 64-bit port or as two 32-bit ports. Lets one 32-bit port handle digital video while the other processes graphics using the same or different color lookup tables. Supports mixing video with still graphics, uses a convolution filter to minimize flicker in line-interlaced displays, and supports displays with clock speeds up to 100 MHz.

Mickey

Accepts analog video signals from Sebastian, provides the encoding to NTSC or PAL digital formats, and produces S-video, composite, and RGB video outputs.

66 MHZ AT&T DSP3210

This processor is a 32-bit floating point processor that provides real- time processing of modem signals, video, sound, and speech recognition data which releases the 68040 from these tasks.

Video In

The video-in capabilities of the Quadra 840AV support full-motion, full-screen viewing of any video material in the NTSC, PAL, or SECAM format.

The video subsystem is completely independant of the CPU or DSP. One of the features provided by this subsystem is the ability to record a quarter screen* image at 10 to 20 frames per second directly to a hard disk in real-time without data compression.

Video-in provides for on-screen viewing of video materials, 24 bit frame capture, and QuickTime movie recording without additional hardware.

* Quarter Screen defintions: There are two competing definitions of a one-quarter size screen, assuming the standard Macintosh 640 x 480 screen. These two definitions are often used interchangeably:

1) The actual number of pixels on the screen divided by 4, equaling 320 x 240 pixels. This is one-quarter of the standard Macintosh 640 x 480 screen and what the QuickTime development team refers to as a one-quarter size screen.

2) The horizontal number of pixels divided by 4, and the vertical number of pixels divided by 4, equaling 160 x 120 pixels. This is one-eighth of the standard Macintosh 640 x 480 screen and what the VideoFusion application (bundled with the Macintosh AV Series) refers as a one-quarter size screen.

Video Out

The Quadra 840AV provides standard video output in both the NTSC and PAL formats. This allows you to send the video output directly to standard video inputs such as those on TV monitors, VCR's, etc.

The Quadra 840AV also supports convolution, 7 levels of transparency for blending video and graphics and Chroma-keying.

Apple IIc: Setting serial port 2's firmware from BASIC

If DOS or ProDOS is in RAM, you can access the firmware of serial port 2 from BASIC using the list of command codes below.
This article has been archived and is no longer updated by Apple.
- To change a firmware setting when the port is in terminal mode, issue a CTRL-D (hex 04), IN#2, the command character CTRL-A, and the command code.

- To change a firmware setting when the port is in non-terminal or local mode, issue a CTRL-D (hex 04), IN#2 or PR#2, the command character CTRL-A, and the command code.

- To change the firmware setting without DOS or ProDOS, leave CTRL-D out of the string and issue the IN#2 or PR#2, command character, and code.

As soon as you issue the command character, the serial port firmware displays a flashing question mark cursor to indicate that it's awaiting a command code. If you press RETURN, you get the current video cursor again. You do not have to press RETURN after command codes.

Subsequent input and output are routed to the modem (or other communications device) connected to serial port 2 until the next IN# commands that the input be routed to another port. You can therefore issue the CTRL-D and IN#2 and then a string of command codes, each beginning with the command character CTRL-A, to change more than one setting of the port firmware.

We recommended two substitutes to the command character CTRL-A: CTRL-V and CTRL-W. To make the substitution, issue the current command character and follow it with the substitute command character, e.g. CTRL-A CTRL-V.

For example, to set the port and startup AppleWorks:

1. Write a program to set the Apple IIc port and end the program with the line:

```
50 D$=CHR$(4)
100 PRINT D$;"-APLWORKS": REM Launch AppleWorks
```

2. Save the program as STARTUP on the AppleWorks startup disk.

3. Rename the file /APPLEWORKS/APLWORKS.SYSTEM as /APPLEWORKS/APLWORKS to match the named file in line 100 in step 1 above.

4. Copy the file BASIC.SYSTEM to the AppleWorks startup disk.

5. Boot the AppleWorks startup disk. STARTUP will set the port and then pass control to AppleWorks.

- Modem Port Command Codes:

1. Line width
a. Code: A number from 1 through 255 followed by a carriage return.
b. Code: A number from 1 through 255 followed by the letter N. This form of the command code also means that output will not be echoed to the screen.
c. To turn off automatic generation of carriage return, either:
1. use the Z command
2. use the System Utilities Disk.

2. Baud rate

Code Rate
1B 50
2B 75
3B 110 (109.92)
4B 135 (134.58)
5B 150
6B 300
7B 600

4P None
5P MARK (1)
6P None
7P SPACE (0)

7. Terminal Mode

Code Effect
T Enter Terminal Mode. Use this command after IN#2 only. If you follow this command by PR#2, the Apple IIc will echo input to output. If the other device does so too, the first character entered will loop endlessly, locking up the system. Use CTRL-RESET to get out.

Q Quit terminal mode.

8. Reset
Code Effect
R Reset port 2 and exit from serial port 2 firmware.

9. Break
Code Effect
S Send a 233 millisecond BREAK character.

10. Ignore
Code Effect
Z Zap (ignore) further command characters until CTRL-Reset.

NOTE: Do not format output or insert carriage returns into output stream.

11. Terminal mode command codes from remote devices

Code Effect
CTRL-T If IN#2 is already in effect, this command puts the Apple IIc in terminal mode, just as does the local command T.

CTRL-R This command undoes the remote terminal mode command. If IN#2 and PR#2 are in effect, the remote keyboard and display become the input and output devices of the local Apple IIc.

WARNING: Apple IIc firmware DOES NOT allow you to use control characters B, C, H, I, J, L, M, or Y: doing so may cause unpredictable effects.

Newton MessagePad: How to Backup and Restore

- **Last Modified:** January 13, 1998
- **Article:** TA29791

- **Old Article:** 12752

This article has been archived and is no longer updated by Apple.
This article describes how to make a backup of your Newton, as well as how to restore backup data.
There are two ways to backup the data on your Newton:

1) Using the Newton Connection Kit
2) Using a PCMCIA Type II storage card

Using the Newton Connection Kit

It is easy to use the Newton Connection Kit to backup up your data to a Macintosh. When you synchronize your Newton MessagePad with the Newton Connection Kit, it performs a backup of the data on your Newton to the Macintosh system to which you connect. Follow the procedure described in your Connection Kit documentation to connect and synchronize the Connection Kit. Once you have done this, you will find three files displayed on your Macintosh:

- Newton
- Newton Archive
- Newton Backup

These three files contain information stored on your Newton MessagePad.

Newton

The file named Newton contains the current backup of all of your Newtons data. You can also use this file, along with the Connection Kit, to add data to your Newton. To do this, enter into this file and synchronize your Newton with the Connection Kit. Your Newton is updated with this new data. Remember that the new data from the Connection Kit replaces all existing data on your MessagePad.

Newton Backup

This file is a copy of the previous synchronization file. When you synchronize, the current synchronization file (the file named Newton) is renamed to Newton Backup, which completely overwrites the old Newton Backup file. Then, a new synchronization file (or Newton file) is created. If you want to keep a copy of the Newton Backup file, you must duplicate it before synchronizing.

Newton Archive

This file contains all information deleted from your Newton since the last time you synchronized. You can use this archive file to recover data that youve inadvertently deleted from your Newton.

During synchronization, the Connection Kit looks at the Newton Backup file to determine which data youve deleted from your Newton since your last synchronization. This data is then copied from the Newton Backup file to the Newton Archive file.

Using a PCMCIA Type II Storage Card

You can keep a backup copy of your Newtons data on a PCMCIA Type II storage card, then restore your data to your Newton from that card.

TA29791_Newton_MessagePad_How_to_Backup_and_Restore.pdf

Making a Backup

These steps describe how to backup to a storage card:

1) Insert a storage card into your Newton. Note that each storage card can only store one backup copy. Existing backup copies are erased to make room for the new one.

2) Tap Extras, then tap Card. When the dialog box appears, tap Backup. When your Newton is finished backp up data, the message box disappears.

Restoring a Backup

These steps describe how to restore information from a storage card:

1) Insert the storage card with your backup copy into your Newton.

2) Tap Extras, then tap Card. You see a dialog box that shows the contents of the storage card.

3) Tap Restore. You see a dialog box that reminds you that you are replacing all of the information in your Newton. This procedure overwrites all data currently in your Newton. Tap OK if you want to continue or Cancel to stop.

Regardless of the method you select, remember to make regular backups!

Archived - Newton MessagePad: How to Insert/Replace Batteries

This article describes how to insert and/or replace the batteries into your Newton.
This article has been archived and is no longer updated by Apple.
There are two different batteries in the Newton, the main battery pack and the backup battery. The main battery pack consists of either a battery holder which contains 4 disposable AAA batteries or a rechargeable nickel-cadmium battery pack. The backup battery is a round disposable 3-volt Duracell DL2032 lithium battery.

Warning: If both the main battery pack and the backup battery are exhausted, you will lose the entire contents of your Newton's memory, including any memory-based system updates that have been loaded into your Newton.

Replacing the Main Battery Pack
---

1) Place your Newton screen-side down on a surface that won't damage the screen.

2) Remove the rear battery cover. You will see a large rectangular opening for the main battery pack, a small round opening for the backup battery, an orange switch and a reset switch.

3) Slide the orange switch to the Replace Main position.

4) Insert a small coin in the slot on the left side of the main battery pack, then use the coin to lift the battery pack out of the battery compartment.

5) If you are using a disposable battery pack, open the door on the battery pack, remove any discharged AAA batteries, and insert fresh batteries. Be sure to orient the batteries as shown on the battery holder.

6) Slide the fresh battery pack into the Newton from left to right and and press the battery pack down into place. Be sure not to damage the spring-style power terminals inside the battery compartment.

7) Move the orange switch to the In Use position.

Note: If you are installing batteries in your Newton for the first time ONLY, press the reset switch with the plastic stylus that is included with your Newton.

8) Replace the rear battery cover. You may now use your Newton.

Replacing the Backup Battery
---

1) Place your Newton screen-side down on a surface that won't damage the screen.

2) Remove the rear battery cover. You will see a large rectangular opening for the main battery pack, a small round opening for the backup battery, an orange switch and a reset switch.

3) Slide the orange switch to the Replace Backup position.

4) If a backup battery is already in place, remove it.

5) Pick up the fresh backup battery by its edges and insert it into its opening. Wipe off any fingerprints with a soft cloth.

Warning: BE SURE to insert backup battery with the positive (+) side up. If the battery is inserted incorrectly, it may explode.

6) Move the orange switch to the In Use position and replace the rear battery cover. You may now use your Newton.

MacTest 6.0: Wrong Error Number During Test Of External Drive

- **Last Modified:** November 09, 1988
- **Article:** TA29809

- **Old Article:** 1277

MacTest 6.0 displays an erroneous error number during the external drive test when it's run for the first time. You can perform a valid test without rebooting simply by running the external drive test a second time.

Follow these steps when you want to use MacTest 6.0:

1. Boot MacTest 6.0 on either a 512K or 128K Macintosh. Run all tests by choosing Start.

2. If all is well, Pass will be highlighted. Choose Select Test, then specify that only the external drive test be run.

3. Click on Start. MacTest will return a Failed message with the number 50010.0004.

4. Click on Start again. This time the drive test should run properly. If the external drive is good, the test will indicate "Pass"; if the test returns a "Failed" message again, the drive is indeed faulty.

Newton MessagePad: How to Capitalize a Word

Will my Newton capitalize a word that it's recognized without opening the keyboard and retyping the whole word?
This article has been archived and is no longer updated by Apple.
Newton will automatically capitalize words at the beginnings of sentences, but it can't automatically capitalize proper names, or sense when you intend an whole word to be spelled with all capital letters. You can, however, capitalize words or change their case after they have been recognized by your Newton.

To tell Newton to change the case of a letter:

1) Select the word.

2) Draw a vertical line (not with the selecting gesture) up through a letter you want uppercase, down through a letter you want lowercase.

To tell Newton to capitalize all the letters in a word or words:

1) Select the word or words.

2) Draw a line through the middle of the word; up for all caps, down for lowercase.

Newton MessagePad: Using the Newton Assistan

- **Last Modified:** October 04, 2008
- **Article:** TA29816

- **Old Article:** 12784

This article has been archived and is no longer updated by Apple.

How do I use the Newton Assistant?

The Newton Assistant is the intuitive part of Newton. You may ask it to do things for you using various key request words. These words may or may not be capitalized, and each has several acceptable synonyms. Here is a list of the request words, along with the action they take:

Request Word Action
------------ ------
call, ring, dial --------- Dial a phone number

fax, fax it ------------ Send the item on your screen as a fax (requires a Newton fax modem)

find, find it, look for ----- Search for text search for, locate, locate it

mail, link, e-mail, ------ Send the item on your screen as send this electronic mail
mail this

print, print it ---------- Print the item on your screen (requires a printer)

remember, remind, ----- Add a reminder to your to do list to do, don't forget to, don't let me forget, don't let me forget to do
remind me,

schedule, meet, meet me, -- Add an appointment to your calendar
see, talk to,

- breakfast (implies 7 a.m.),
- lunch (implies noon),
- dinner (implies 7 p.m.),
- holiday (implies day note instead of appointment),
- birthday, bday, b-day, anniversary (all imply a day note that repeats every year)

time, time in, the time in, -- Look up the time in another city
what time is it, what time is it in,
what time, what is the time,
what is the time in

NOTE: You will often ask Newton to do something involving another person. For instance, you may write "lunch with Eric Tuesday." Newton will scan your Names File for Eric, and schedule lunch with him on the following Tuesday. The more complete your Names File, the more helpful the Assistant will be.

Requests in the Assist Drawer

---

1) Tap the Assist button on the bottom-right of your screen.

2) Tap Please, and choose the appropriate request word. After the request word, write as much information as you can -- such as where, when and with whom -- to direct Newton's action.

3) Tap the Do button.

4) In the confirmation slip that pops up, make any additions or adjustments to the information displayed.

5) Tap the confirmation button at the bottom of the window to tell Newton to follow through on your request (schedule, print, fax, mail, etc.).

Requests Outside the Assist Drawer

---

1) Write at least one word of your request, beginning with the request word.

2) Select your request, using the select motion.

3) Tap Assist. If Newton is able to decipher your entry, confirmation slip will pop up.

4) Make any additions or adjustments to the confirmation slip.

5) Tap the confirmation button.

Confirmation Slips

Each request, except for Time, has a confirmation slip. Here are some tips on using them:

- Tap the diamonds for suggestions for filling in blanks.
- Fill out all required information, then tap the confirmation button.

NOTE: The more information you offer Newton in the Assist drawer, the more complete the call confirmation slip will be.

Using the Assistant to Dial the Phone

---

1) Tap Assist.

2) Tap Please, then tap Call, or write an accepted synonym for Call (as listed above) in the blank. Write the name of who you want to call, and the person's number. Tap Do.

3) If you cannot remember the person's number, Newton will fill in the first number listed under that name in its file. If there is more than one number for that person, choose the number you want Newton to dial by tapping the diamond by the word phone. (Hint: If you include the word "home," "work," or "beeper," Newton will look up the proper number. For instance, if you write "call Elaine's beeper" or "call Elaine home," Newton will fill in the proper number in the blank.)

4) Tap Speaker to have Newton dial through its speaker or tap Modem to have Newton dial through the modem.

5) Tap Options to set the calling options, such as your access code for your electronic mail server or a credit card number to charge long-distances costs to.

6) Tap Call.

7) If you tapped Speaker in step 3, hold your Newton to the speaker of the phone. If the call does not go through, try turning the sound volume up under Preferences in the Extras drawer.

Using the Assistant to Fax

---

1) Tap Assist.

2) Tap Please, then tap Fax, or write an accepted synonym for Fax (as listed above) in the blank. Write the name of the person to whom you want to fax. Newton will look in the Names File for the person you list. Tap Do.

3) If the names card for that person has a fax number, Newton will fill in that blank on the confirmation slip. If not, fill it in yourself.

4) Select the box next to cover page if you want one. Tap Notes to write comments on the cover sheet.

5) Tap Options to enter a credit card number to charge any long-distance costs.

6) Tap Preview to view the fax as it will be sent. Tap Fax if everything is correct.

Using the Assistant to Mail
---
1) Tap Assist.

2) Tap Please, then tap Mail, or write an accepted synonym for Mail (as listed above) in the blank. Write the name of the person you want to mail the item to. Newton will look in the Names File for the person you list. Tap Do.

3) If the Names card for that person includes a electronic mail address, it will fill in that blank on the confirmation slip. If not, fill it in yourself.

4) Fill in the subject blank.

5) Tap the diamond next to format and choose a style.

6) Tap Preview to view the message as it will be sent.

7) Tap Mail to mail the message now.

8) Tap Mail Later to mail the message later. The item will wait in the Out Box in the Extras drawer until you tap it later to send it.

Using the Assistant With the To Do List
---
1) Tap Assist.

2) Tap Please, then tap Remember, or write and accepted synonym for Remember (as listed above) in the blank. Write what you want to remember to do. Tap Do.

3) Scrub out the date and time on the confirmation slip, and write in the date on which you want the reminder to appear.

4) Tap Do.

Using the Assistant to Print
---
1) Tap Assist.

2) Tap Please, then Tap Print. Tap Do.

3) Tap Printer to select a printer.

4) Tap Format to choose a style.

5) Tap Preview to view how the item will be printed.

6) Tap Print.

7) If your Newton is hooked to a printer, the item will be printed. If not, It will be put into the out box. When your Newton is hooked up to a Printer, go to the out box and print the item from there by tapping it.

Using the Assistant to Schedule an Appointment
---
1) Tap Assist.

2) Tap Please, then tap Schedule, or write an accepted synonym for Schedule (as listed above) in the blank. Be as specific with the synonym for

Schedule as you can; for instance, if you want to schedule a lunch date, write lunch. You may write who you want to schedule the appointment with in the blank, or the date of the appointment.

Note: The more you write in the blank, the more fully Newton can complete the confirmation slip.

3) Scrub out the date on the when line of the confirmation slip and enter the correct date and time. Tap the diamond to see how Newton interpreted what you wrote. You may need to double tap the when line to use a keyboard to write the date and time.

4) You may fill in any or all of the other blanks for the location and subject of the appointment or with whom you are having the meeting.

5) Tap Schedule.

Using the Assistant to Determine the Time or Time Zone
---
1) Tap Assist.

2) Tap Please, then tap Time, or write an accepted synonym for Time (as listed above) in the blank. Write the name of the city you want to know about. Tap Do.

3) Newton will open the time zone map and show you the date and time in the city you've chosen. If the city you write in the blank is not in Newton's list, Newton will tell you it is unable to decipher your request.

Note: There is no confirmation slip for time requests.

Newton MessagePad: What to Do When Newton "Crashes"

My Newton froze and won't let me do anything. I can't even turn it off. What do I do?
This article has been archived and is no longer updated by Apple.
If your Newton freezes or "hangs," take your stylus and press the Reset button in the battery compartment on the back of your Newton. This should allow you to restart your Newton.

Newton Connection Kit for Macintosh: Installation

- **Last Modified:** January 16, 1998
- **Article:** TA29853

- **Old Article:** 12844

This article has been archived and is no longer updated by Apple.
This article discusses installing the Newton Connection Kit for the Macintosh and connecting your Newton to your Macintosh.
The Newton Connection Kit allows your Macintosh to communicate with your Newton. You can backup and restore Newton data, examine the data on your Macintosh and download Newton software applications to your Newton.

Installing the Connection Kit

Here's how to install the Newton Connection kit onto your Macintosh:

1) Insert the disk entitled, "Newton Connection Kit Install 1" into the floppy drive of your Macintosh.

2) Double-click the Installer icon.

3) Click OK in the welcome dialog box that appears.

4) In the Installer box, click Install.

5) Follow the instructions on the screen. Insert the disk entitled "Newton Connection Kit Install 2" when the program requests it.

Connecting to a Macintosh

There are two ways to connect the Newton to the Macintosh: via a serial cable or an LocalTalk network. The network connection is more complicated, but enables faster communication.

Here's how to connect with a serial cable:

1) Plug one end of the serial cable into your Newton.

2) Plug the other end into the printer port on your Macintosh.

Here's how to connect over a LocalTalk Network:

1) Make sure your computer is turned off.

2) Follow the instructions that accompanied your Apple LocalTalk kit to connect your Macintosh to a network if it is not already connected.

3) Plug the LocalTalk cable into the communications port on the lower-right side of your Newton.

4) Turn on your Macintosh and choose the Chooser from the Apple menu.

5) Make sure AppleTalk is active in the window that appears.

When you want to disconnect your Newton, remove the cable from the Newton communications port and leave everything else connected. When you want to re-establish the connection between your Macintosh and Newton, plug the cable in again.

Note: If you connect Newton to a PowerBook that has an internal modem, you need to open the PowerBook control panel and select the External Modem button to complete the serial connection.

Newton Connection Kit for Macintosh: Synchronizing

- **Last Modified:** October 04, 2008
- **Article:** TA29854

- **Old Article:** 12845

This article has been archived and is no longer updated by Apple.

This article discusses synchronizing files between the Newton and Macintosh.

The first time the Newton Connection Kit synchronizes your Newton with your Macintosh, all the information from your Newton will be copied onto your Macintosh's hard drive. After the first time, synchronizing will copy only new or changed information from Newton to your Macintosh or vice versa. When synchronization is completed, the identical information exists both in the Newton folder on your Macintosh's hard drive and in your Newton.

When you synchronize, all information you deleted since the previous synchronization is stored in an Archive file on the Macintosh. The entire file left by the previous synchronization will be stored as a file called "Backup."

How to Set Up For Synchronization

To prepare the Macintosh for communication with the Newton:

1) Double-click the Newton Connection icon.

2) Choose Preferences from the Edit menu.

3) In the dialog box that appears, click on the method you used to connect your Newton and Macintosh. Click OK to save your preferences, and close the box. (You only need to do this the first time you use the Connection software, unless you change the setup.)

4) Click the Synchronize button. A message will appear to confirm that the Macintosh is ready.

To prepare the Newton for connection:

1) Tap the Extras button on Newton's screen.

2) Tap the Connection button.

3) Tap "Macintosh serial" or "Macintosh LocalTalk" to indicate how you are set up. (If you are using a serial cable, skip to the next section, titled Synchronizing.)

4) If you chose Macintosh LocalTalk, tap the Choose Macintosh button that appears.

5) A list of Macintoshes that are running Newton Connection appear. If the one you want is not listed, tap Change Zone and choose the proper zone (if your network doesn't have zones, this button will not appear). If the Macintosh you want does not appear, make sure the Connection software is launched on that computer.

6) Tap the Macintosh you want.

7) To begin synchronizing, tap Connect. To stop at any time, tap Stop.

The process will copy all the information that has changed since the last synchronization from your Newton onto the Macintosh's hard drive in a file that bears your name. If you haven't entered your name in your Newton, the file will be called Newton.

If you want to synchronize automatically, choose Preferences from the Edit menu and click "Always ready to synchronize."

Setting Up a Synchronization Station

If you use Newton Connection on a network with other Newton users, you may want to establish one Macintosh where everyone can synchronize and store their Newton files.

To do this:

1) Make sure the chosen Macintosh is hooked into the network.

2) Open Newton Connection.

3) Turn on "Always ready to synchronize" in the Preferences box (in the Edit menu).

4) Always leave the station Macintosh on.

5) Make sure everyone who uses the station has his or her name entered in Newton's Personal area under Preferences in the Extras drawer. This ensures that everyone's synchronization files will be stored separately.

Newton Changes Take Precedence

Immediately after you complete synchronization, the information in the Newton folder on your hard drive and on your Newton are identical. If you change the same piece of information in both places, when you next synchronize, the changes you made on the Newton will take precedence.

For instance, if you change Bob's address in the Names File on Newton, and Bob's title in the Names File on your Macintosh, both files will reflect Bob's new address, but not his new title. The changes you made on the Macintosh --Bob's title -- will be saved into the Newton archive folder on the Macintosh.

Archived - PowerBook 100: Creating and Using a RAM Disk(7/93)

How can I use a RAM disk to maximize the power of my PowerBook 100?

Products Affected

PowerBook

This article has been archived and is no longer updated by Apple.
The PowerBook 100 is uniquely suited to the use of a RAM disk, because it's the only PowerBook with batteries that supply power to RAM even when the computer is shut down. On all other PowerBooks, the RAM is erased upon shut down.

Since PowerBooks are set to turn off their hard drives after several minutes of inactivity, simple tasks like saving or opening new documents require that the hard disk spin up again. This takes time and battery power. However, you can allow the hard disk to spin down and stay there if you use a RAM disk.

However, RAM disks are only efficient if you have 6MB or more of memory on your hard disk.

An ideal RAM disk has a System Folder, applications, documents and anything else you'd store on any disk. But for safety, it's a good idea to back up the information on the RAM disk to your hard drive periodically.

You will find, while using a RAM disk, that your battery life improves significantly.

Creating a RAM Disk
---
1) Choose Control Panels from the Apple menu.

2) Open the Memory control panel.

3) Click the On button beneath the words "RAM disk."

4) Drag the slider to choose the percentage of available memory you want to use for your RAM disk. The default size is 100 percent of available memory over 2 MB; that is, the largest RAM disk you can have. The size appears in the "RAM Disk Size" box.

5) Close the control panel.

6) Choose Restart from the Special menu. A RAM disk appears on the desktop.

Making a RAM Disk Your Startup Disk
---
1) Insert the Install 1 floppy disk that came with your PowerBook.

2) Open the Installer program.

3) Click the Switch Disk button until the RAM disk is displayed.

4) Click Customize.

5) Scroll through the list of items until you see "Min System for Macintosh PowerBook 100.

6) Click Install, and follow the instructions on the screen.

7) Click Quit.

8) Choose Control panels from the Apple menu.

9) Open the Startup Disk control panel.

10) Select the RAM disk as your Startup disk.

11) Choose Restart from the Special menu.

Make a backup copy of the disk a soon as you can, and back up its contents regularly to the hard drive.

Removing the RAM Disk

If you later decide to remove the RAM disk:

1) Throw its contents away and empty the trash.

2) Choose Control Panels from the Apple menu.

3) Choose the Memory control panel.

4) Move the slider in the memory control panel to 0 percent.

ImageWriter: MacWrite Form Feed Feature

- **Last Modified:** March 09, 1998
- **Article:** TA29865

- **Old Article:** 1286

DISCUSSION

The Finder 4.1 update disk includes Imagewriter code that was revised and released in March 1985. When MacWrite starts to print documents with the "no breaks between pages option", MacWrite assumes that the pinch rollers are at the starting edge of the paper. The paper is rolled backward from this standard starting position whenever there is information in the top half-inch of the page, as is the case with labels, or when the "no breaks between pages " option is in effect. When the starting edge of the paper is rolled backward, this starting edge may slip out from between the pinch rollers and the platen; the edge of the paper may then cause a jam when it's moved forward as printing continues.

The Finder 4.1 disk, therefore, includes special new Imagewriter code that sends a form feed to the Imagewriter before MacWrite begins to print. This puts extra paper beyond the pinch rollers so that the Imagewriter can back up the paper without losing of control of it.

To avoid the form feed, either don't enter information in the top half-inch of the page or don't select "no breaks between pages", selecting "normal pages" instead.

ImageWriter Hardware Communication Problems

This article has been archived and is no longer updated by Apple.

DESCRIPTION:
This table is composed of typical Imagewriter communication problems
and fixes. If your problem matches a symptom, perform the appropriate fix.

YOU WILL NEED:
1. Apple IIe computer
2. Super Serial Card and printer cable
3. Level I Tech Procedures
4. Imagewriter User's Manual
5. Pencil and paper

BEFORE YOU START:
1. If replacement or adjustment procedures are needed, refer to the Tech
Procedures.
2. If a replacement doesn't fix the problem, reinstall the original
module/part before proceeding with the procedure.
3. If location for IW controls are needed, refer to the User's Manual.

INSTRUCTIONS: In order to isolate a hardware communications problem, you
first need to eliminate the possibility of a software or DIP switch
configuration problem. To do this perform the following:

1. Turn off the printer, write down the customer's Super Serial Card and
printer DIP switch configurations. Set the DIP switches as shown below:
(Note: Op = open, Cl = closed, up = On, dn = Off)

_____IW-SW2_____ _____IW-SW1_____
Cl Cl Op Op Op Op Op Op Cl Cl Op Cl
1 2 3 4 1 2 3 4 5 6 7 8

_____SSC-SW1_____ _____SSC-SW2_____
Off Off Off On Off On On On Off Off On On Off Off MODEM/TERM jumper
1 2 3 4 5 6 7 1 2 3 4 5 6 7 block to TERM

2. Remove all peripheral cards from the IIe. Install the Super Serial card
in slot 1. Connect the IW to the S/S card via printer cable
Turn on the IW (make sure cover is installed). Turn on the IIe and press
the RESET key while you press the CONTROL key (DO NOT BOOT A DISK). The
cursor should blink.

Type the program exactly as shown below.

```
10 PR#1
20 FOR A = 1 TO 100
30 FOR I = 32 TO 126
30 PRINT CHR$(I);:NEXT I:PRINT
40 NEXT A
50 PR#0
60 END
```

3. Type RUN and press the <RETURN> key. The printer should print
out about 100 character sets like the one shown below. If it does, the
IW communicates with the computer OK.

!#$%&'()*+,-./0123456789:;<>?@ABCDEFGHIJKLMNOPQRSTUVWXYZ[\\]^_'abcdefghijklmno
pqrstuvwxyz{|}

If the printout is not OK, look below for problems.

* If you get a SYNTAX ERROR on the computer, you may have mis-typed a line. To correct the syntax error perform the following:
(1) Type LIST and press <RETURN>. The program should appear on the screen.
(2) Examine the program for accuracy. Spaces, colons, etc. are important.
(3) To correct a line, simply retype the line and press <RETURN>. LIST again to make sure the correction is OK.

* If nothing happens on the printer or the computer, press the RESET key while you press the CONTROL key. Then LIST your program as described above in the SYNTAX ERROR explanation to look for typing errors.

* If no syntax errors occured and the cursor is blinking again, then the program has probably run OK so check for the problems below:

PROB: The printer does not print a set of characters.
FIX: Recheck for the problem after each of the following steps. If no problem is found, go to step 4.
(1) Check that the computer is properly powered on and initialized.
(2) Check that the SEL light is on. If it's not, press SEL and try to print from the computer again using the program above. If it prints while the SEL light is off, replace the switch panel.
(3) Make sure that the interface cable between the printer and the computer is connected and secured at both ends.
(4) Replace main logic PCB.

PROB: The printer prints a set of characters but print quality is poor.
FIX: Do a word search for "Imagewriter and HTS and Self Test Problems" to obtain the print quality FIX.

4. Reset the DIP switches to the customer's original configuration. Then refer to the User's Manual and the Appendix in the Imagewriter section of the Tech Procedures to see if the customer's DIP switch configuration caused the problem.

Quadra: Where to Find Brackets for Drives (8/93)

Article Created: 11 August 1993

I bought a third-party tape drive for my Quadra and it didn't come with the proper size bracket or a faceplate for the front of the computer. Can I order these items from Apple?

This article has been archived and is no longer updated by Apple.
Apple does not sell these parts individually.

You'll need to contact the vendor who sold the storage device to obtain the correct bracket and front template for your Quadra.

If you have any problems, contact your local authorized Apple dealer or call Apple's Customer Assistance Center for further help.

Duo Dock/Duo Dock II: External Pinouts

- **Last Modified:** August 07, 1997
- **Article:** TA29922

- **Old Article:** 12929

This article gives the pin assignments and functions for the connectors on the Duo Dock and Duo Dock II.

Main Expansion Connector (Processor-Direct Slot)

A 152-pin main expansion connector, JAE part number JX20-152BA-D1LTH, provides the interface between the PowerBook Duo computer, and the Duo Dock. It mounts directly to the Duo Dock's main logic board, and plugs into the matching connector on the PowerBook Duo rear panel, giving the Duo Dock direct access to the microprocessor's 32-bit address bus, 32-bit data bus, and control signals. It also provides access to power, control, and status signals in other parts of the computer, and allows the Duo Dock to provide power to the PowerBook Duo.

The table below lists the subset of signals used for the Duo Dock interface. A slash before a signal name (/AS) indicates an active-low signal.

Pin number	Signal name	Description
1, 2, 77, 78, 79	PR +24V EXT	Raw +24 V from AC adapter
3	/PLUG IN	Power surge control (grounded in the expansion device)
4, 19, 20, 30, 38, 39, 51, 61, 65, 66, 80, 81, 115, 141, 142	GND	Logic ground
7	/ON/OFF OUT	On/off button
9	/STERM	Synchronous termination
10	/DS	Data strobe
11	/AS	Address strobe
12, 29, 42,	+5V MAIN OUT	+5 V regulated power
13	/HALT	Halt
14	/BERR	Bus error
15	/BGACK	Bus grant acknowledge
21	ADDR[0]	Address bit 0
22	ADDR[2]	Address bit 2
23	ADDR[4]	Address bit 4
24	ADDR[6]	Address bit 6
25	ADDR[8]	Address bit 8
26	ADDR[10]	Address bit 10
27	ADDR[12]	Address bit 12
28	ADDR[14]	Address bit 14
31	ADDR[18]	Address bit 18
32	ADDR[20]	Address bit 20
33	ADDR[22]	Address bit 22

34	ADDR[24]	Address bit 24
35	ADDR[26]	Address bit 26
36	ADDR[28]	Address bit 28
37	ADDR[30]	Address bit 30
40	IOCLK	15.6672 MHz I/O clock
41	SIZ[1]	Transfer size bit 1
43	DATA[0]	Data bit 0
44	DATA[1]	Data bit 1
45	DATA[2]	Data bit 2
46	DATA[3]	Data bit 3
47	DATA[4]	Data bit 4
48	DATA[5]	Data bit 5
49	DATA[6]	Data bit 6
50	DATA[7]	Data bit 7
52	DATA[17]	Data bit 17
53	DATA[18]	Data bit 18
54	DATA[19]	Data bit 19
56	DATA[20]	Data bit 20
57	DATA[21]	Data bit 21
58	DATA[22]	Data bit 22
59	DATA[23]	Data bit 23
62	/SCC IRQ	SCC interrupt request
63	SERVEE	-5 V for SCC transceivers
67	+8V SOUND	Special "clean" +8 V power for sound output
68	+5V MODEM	+5 V power for modem
69	LINET/R	Modem DAA line talk/receive
70	+5V SOUND	+5 V power for sound output
72	SND OUT L	Sound output left channel
73	EXT MIC FILT R	Right input signal from external microphone
74	EXT MIC FILT L	Left input signal from external microphone
75, 76, 151, 152	DAA GND	Modem ground
83	ADB DATA	Apple Desktop Bus data
84	/ADBPWRON	ADB power-on key
86	/CBREQ	Cache burst request
87	/DSACK1	Data size acknowledge bit 1
88	/DSACK0	Data size acknowledge bit 0
89	/BR	Bus request
90	/BG	Bus grant
91	/SLEEP	Sleep-state signal
92	FC[1]	Function code bit 1
93	FC[0]	Function code bit 0
94	/RMC	Read-modify-write cycle
95	CPUCLK	CPU bus clock

96	/CPURESET	CPU reset (bus invalid)
97	ADDR[1]	Address bit 1
98	ADDR[3]	Address bit 3
99	ADDR[5]	Address bit 5
100	ADDR[7]	Address bit 7
101	ADDR[9]	Address bit 9
102	ADDR[11]	Address bit 11
103	ADDR[13]	Address bit 13
104	ADDR[15]	Address bit 15
105	ADDR[16]	Address bit 16
106	ADDR[17]	Address bit 17
107	ADDR[19]	Address bit 19
108	ADDR[21]	Address bit 21
109	ADDR[23]	Address bit 23
110	ADDR[25]	Address bit 25
111	ADDR[27]	Address bit 27
112	ADDR[29]	Address bit 29
113	ADDR[31]	Address bit 31
114	/SLOT IN	Expansion device plugged in grounds pin
116	RD	Read/Write
117	SIZ[0]	Transfer size bit 0
118	DATA[8]	Data bit 8
119	DATA[9]	Data bit 9
120	DATA[10]	Data bit 10
121	DATA[11]	Data bit 11
122	+5VEXTSENSE	+5 V external sense
123	DATA[12]	Data bit 12
124	DATA[13]	Data bit 13
125	DATA[14]	Data bit 14
126	DATA[15]	Data bit 15
127	DATA[16]	Data bit 16
128	DATA[24]	Data bit 24
129	DATA[25]	Data bit 25
130	DATA[26]	Data bit 26
131	DATA[27]	Data bit 27
132	DATA[28]	Data bit 28
133	DATA[29]	Data bit 29
134	DATA[30]	Data bit 30
135	DATA[31]	Data bit 31
137	/SWIM CS	SWIM chip select
138	/SLOT E IRQ	Pseudo-NuBus expansion slot E interrupt
139	/PFW	Power fail warning (shutdown bit)
140	/IO RESET	Reset output to I/O systems
143	DAA CNTLF	Modem DAA control

144	DAA ID IN	ID input from 152-pin connector to modem card
145	/RING DET	Ring detect signal from the modem DAA
146	/RB DVR	Modem relay B driver
147	/RA DVR	Modem relay A driver
148	EXT MIC SEL	External microphone plugged in

Video Port

The video connection is made through a standard DB-15 connector.

Pin number	Signal name	Description
1	RED GND	Red ground
2	RED VID	Red video signal
3	/CSYNC	Composite sync
4	SENSE0	Monitor sense bit 0
5	GRN VID	Green video signal
6	GRN GND	Green ground
7	SENSE1	Monitor sense bit 1
8	mc	No connection
9	BLU VID	Blue video signal
10	SENSE2	Monitor sense bit 2
11	C&VSYNC GND	Ground for CSYNC and VSYNC
12	/VSYNC	Vertical sync
13	BLU GND	Blue ground
14	HSYNC GND	HSYNC ground
15	HSYNC	Horizontal sync

HDI-30 SCSI Connector

Pin number	Signal name	Description
1	nc	Reserved for SCSI disk mode.
2	/DB0	Bit 0 of SCSI data bus
3, 8, 10, 12, 13, 15, 17, 20, 22, 24	GND	Ground
4	/DB1	Bit 1 of SCSI data bus
5	TPWR	Termination power
6	/DB2	Bit 2 of SCSI data bus
7	/DB3	Bit 3 of SCSI data bus
9	/ACKS	Handshake signal. When low acknowledges a request for data transfer
11	/DB4	Bit 4 of SCSI data bus
14	/DB5	Bit 5 of SCSI data bus
16	/DB6	Bit 6 of SCSI data bus
18	/DB7	Bit 7 of SCSI data bus
19	/DBP	SCSI data bus parity bit
21	/REQ	Request for a data transfer
23	/BSY	When active (low) indicates that the SCSI data bus is busy

25	/ATN	When active (low) indicates an attention condition
26	/C/D	When active (low) indicates that data is on the SCSI bus. When high, indicates that control signals are on the bus
27	/RST	SCSI bus reset
28	/MSG	Indicates the message phase
29	/SEL	SCSI select
30	/I/O	Controls the direction of data output. When high, data is input

Modem and Printer Ports

Pin number	Signal name	Description
1	HSKo	Handshake output. Connected to the Request to Send (RTS) pin on the Combo chip. Tristated when the Data Terminal Ready (DTR) signal is inactive.
2	HSKi	Handshake input. Connected to the Transmit Receive Clock(TRXC) pin on the Combo chip.
3	/TXD	Transmit data (inverted). Connected to the Transmit Data (TXD) pin on the Combo chip. Tristated when DTR is inactive.
4	SG	Signal ground. Connected to logic and chassis ground.
5	/RXD	Receive data (inverted). Connected to the Receive Data (RXD) pin on the Combo chip.
6	TXD	Transmit data. Connected to the Transmit Data (TXD) pin on the Combo chip. Tristated when DTR is inactive.
7	GPi	General purpose input. Connected to the Data Carrier Detect (DCD) pin on the Combo chip.
8	RXD+	Receive data. Connected to the Receive Data (RXD) pin on the Combo chip.
10, 11, 12	GND	These pins are connected to chassis ground.

Apple Desktop Bus Interface

Pin number	Signal name	Description
1	ADB	Bidirectional data bus for input and output
2	POWER ON	Key on ADB keyboard (if connected) grounds this pin to pin 4, enabling power to be turned on from the keyboard
3	+5V	+5 V power
4	GND	Logic ground
5, 6, 7	GND	Chassis ground

Sound Ports

Two monaural mini phone jacks provide connections for sound input and output.

Modem Adapter Card (optional)

When the PowerBook Duo computer is housed in the Duo Dock, you cannot access the integral modem via the RJ-11 connector on the PowerBook Duo's rear panel. A modem adapter card provides the connection. It plugs into the side of the Duo Dock's

main logic board, using a 10-pin header connector. The card supplies the RJ-11 hook up, which is accessed on the rear panel of the Duo Dock. The adapter card interfaces with the modem card in the PowerBook Duo computer via its 10-pin connector, printed circuit traces, and the 152-pin expansion connector. The table below lists the signal assignments for the connector.

Modem Adapter Connector Signal Assignments

Pin number	Signal name	Description
1	LINET/R	Line/talk receive
2, 3, 4	DAA GND	Modem DAA ground
5	/RA DVR	Modem relay A driver
6	DAA ID IN	ID input
7	/RING3 DET	Ring detect signal
8	/RBDVR	Modem relay B driver
9	DAA CNTL	Modem DAA control
10	+5 V MODEM	+5 V power

Built-In Ethernet Connector (Duo Dock II only)

Pin	Signal name	Description
1	FN Pwr	Power (+12V @ 2.1W or +5V @ 1.9W)
2	DI-A	Data In circuit A
3	DI-B	Data In circuit B
4	VCC	Voltage Common
5	CI-A	Control In circuit A
6	CI-B	Control In circuit B
7	+5V	+5 volts (from host)
8	+5V	Secondary +5 volts (from host)
9	DO-A	Data Out circuit A
10	DO-B	Data Out circuit B
11	VCC	Secondary Voltage Common
12	NC	Reserved
13	NC	Reserved
14	FN Pwr	Secondary +12V @ 2.1W or +5V @ 1.9W
Shell	Protective Gnd	Protective Ground

AAUI signals have the same description, function, and electrical requirements as the AUI signals of the same name, as detailed in IEEE Standard 802.3-1990 CSMA/CD, section 7.

TA29932_Apple_III_Hardware_5-volt_Confidence_RAM_Test_(TIL01294).pdf

Apple III Hardware: 5-volt Confidence RAM Test

This article has been archived and is no longer updated by Apple.

There is a Confidence RAM Test for Apple IIIs on the Confidence Disk and the Dealer Diagnostic Disk. With this test, you can locate bad chips on a 5-volt board.

--> NOTE: Before runnning the Confidence RAM test, remove all peripheral cards from the Apple III, especially any ProFile interface cards and Grappler printer cards.

The test results show the bank, address, and test expectations and actual performance. For example, after the test, say the console displays:

BNK 82, ADR 37AF, EXP 40, GOT 48.

To locate the bad chip, you must translate these results into a map that corresponds to the 2 banks of 16 chips on the memory board.

1. The bad chip is in bank 2. The bank number comes from the last digit of the BNK field.

BANKS: 0, 1, 2 X X X X X X X X X X X X X X X X
BANKS: 3, 4, 5, 6 x x x x x x x x x x x x x x x x

2. The bad chip is in the right side of the bank. The side is determined by the range into which the address--37AF, the number in the ADR field--falls.

ADDRESS RANGE: ADDRESS RANGE:
4000-7FFF 2000-3FFF
8000-9FFF

BANKS: 0, 1, 2 x x x x x x x x X X X X X X X X

ADDRESS RANGE: ADDRESS RANGE:
4000-7FFF 2000-3FFF
8000-9FFF

BANKS: 3, 4, 5, 6 x x x x x x x x x x x x x x x x

3. The bad chip is D5. The bad chip shows up in the comparison of the binary representation of the hexidecimal values in the fields EXP and GOT, which contain the test expectations and performance. Any difference between the two indicates where to find the bad chip or chips.

hexidecimal binary hexidecimal binary hexidecimal binary

0 0000
1 0001 6 0110 B 1011
2 0010 7 0111 C 1100
3 0011 8 1000 D 1101
4 0100 9 1001 E 1110
5 0101 A 1010 F 1111

EXP = 40 (hexadecimal) = 01000000 (binary)
GOT = 48 (hexadecimal) = 01001000 (binary)

EXP = 40 (hexadecimal) = 0 1 0 0 0 0 0 0 (binary)
GOT = 48 (hexadecimal) = 0 1 0 0 1 0 0 0 (binary)
ok ok ok ok ! ok ok ok

ADDRESS RANGE:
2000-3FFF

BANK 1 x x x x x x x x x x x x X x x x

In the chip location number D5, the letter comes from the letter of the banks of chips on the memory board:

LETTER: D
BANKS: 0, 1, 2 x x x x x x x x x x x x X x x x

LETTER: C
BANKS: 3, 4, 5, 6 x x x x x x x x x x x x x x x x

The number comes from the number of the chip on the memory board:

NUMBER: 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2

LETTER: D x x x x x x x x x x x x X x x x (BANKS 0, 1, 2)
C x x x x x x x x x x x x x x x x (BANKS 3, 4, 5, 6)

Replace the bad memory chip(s) and run the test again. If the system fails the memory board test, exchange the memory board itself. If that dosen't help, exchange the main logic board.

Macintosh Plus: External Pinouts (5/93)

Article Created: 29 April 1993

This article gives the pin assignments and functions for the external connectors on the Macintosh Plus.

This article has been archived and is no longer updated by Apple.

Mouse Connector

Pin Name Description, Notes

1 CGND Chassis ground
2 +5V See hardware Description, Notes for power limits
3 CGND Chassis ground
4 X2 Horizontal movement line (connected to VIA PB4 line)
5 X1 Horizontal movement line (connected to SCC DCDA- line)
6 N-C Not connected
7 SW- Mouse button line (connected to VIA PB3)
8 Y2 Vertical movement line (connected to VIA PB5 line)
9 Y1 Vertical movement line (connected to SCC DCDB- line)

Keyboard Connector

Pin Name Description, Notes

1 CGNB Chassis ground
2 KBD1 Keyboard clock
3 KBD2 Keyboard data
4 +5V

External Drive Connector

Pin Name Description, Notes

1 CGNB Chassis ground
2 CGND Chassis ground
3 CGND Chassis ground
4 CGND Chassis ground
5 -12V
6 +5V
7 +12V
8 +12V
9 N-C Not connected
10 PWM Regulates speed of the drive
11 CA0 Control line to send commands to the drive
12 CA1 Control line to send commands to the drive
13 CA2 Control line to send commands to the drive
14 LSTRB Control line to send commands to the drive
15 WrReq- Turns on the ability to write data to the drive
16 HdSel Control line to send commands to the drive
17 Enbl2- Enables the Rd line (else Rd is tristated)
18 Rd Data actually read from the drive
19 Wr Data actually written to the drive

Modem and Printer Ports

Pin	Signal name	Signal description
1	HSKo	Handshake out
2	HSKi	Handshake in/external clock
3	TXD-	Transmit data -
4	GND	Signal ground
5	RXD-	Receive data -
6	TXD+	Transmit data +
7	NC	General purpose input*
8	RXD+	Receive data +

- Connector type: 8-pin minicircular

SCSI Port (25-pin)

Pin	Signal name	Signal description
1	REQ/	Request
2	MSG/	Message
3	I/O/	Input/Output
4	RST/	SCSI bus reset
5	ACK/	Acknowledge
6	BSY/	Busy
7	GND	Signal ground
8	DB0/	Data bit 0
9	GND	Signal ground
10	DB3/	Data bit 3
11	DB5/	Data bit 5
12	DB6/	Data bit 6
13	DB7/	Data bit 7
14	GND	Signal ground
15	C/D/	Common/Data
16	GND	Signal ground
17	ATN/	Attention
18	GND	Signal ground
19	SEL/	Select
20	DBP/	Data parity

21 DB1/ Data bit 1

22 DB2/ Data bit 2

23 DB4/ Data bit 4

24 GND Signal ground

25 NC No connection

- Connector type: DB-25

- Total length of all cables not to exceed 6 m (20 ft.)

WARNING: The SCSI port uses the same type of connector as a standard RS-232, DB-25 serial interface, but it is different electrically. Do not connect any RS-232 device to this connector. Doing so can result in damage to both the device and the Macintosh Classic.

Audio Output Port

Pin Signal name Signal description

(Sleeve) GND Signal ground

(Tip) AUDIO .5 volt peak-to-peak audio signal

- Connector type: Miniature mono phone plug

- The internal speaker is disabled when this port is in use.

Macintosh SE and SE 30: External Pinouts (5/93)

- **Last Modified:** August 11, 1993
- **Article:** TA29939

- **Old Article:** 12947

This article has been archived and is no longer updated by Apple.

Article Created: 29 April 1993

This article gives the pin assignments and functions for the connectors on the back panels of the Macintosh SE and SE/30. The pinouts are the same with the exception of the audio output ports. The Macintosh SE provides a monaural signal and the Macintosh SE/30 a stereo signal. Appropriate information appears below.

Apple Desktop Bus (ADB)

Pin Signal name Signal description

1 ADB Data

2 NC Reserved

3 +5v +5 volts DC

4 GND Signal ground

- Connector type: 4-pin minicircular

- Total length of all cables not to exceed 16 feet (5 meters)

SCSI Port (25-pin)

Pin Signal name Signal description

1 REQ/ Request

2 MSG/ Message

3 I/O/ Input/Output

4 RST/ SCSI bus reset

5 ACK/ Acknowledge

6 BSY/ Busy

7 GND Signal ground

8 DB0/ Data bit 0

9 GND Signal ground

10 DB3/ Data bit 3

11 DB5/ Data bit 5

12 DB6/ Data bit 6

13 DB7/ Data bit 7

14 GND Signal ground

15 C/D/ Common/Data

16 GND Signal ground

17 ATN/ Attention

18 GND Signal ground

19 SEL/ Select

20 DBP/ Data parity

21 DB1/ Data bit 1

22 DB2/ Data bit 2

23 DB4/ Data bit 4

24 GND Signal ground

25 TPWR Terminator power

- Connector type: DB-25

- Total length of all cables not to exceed 20 feet (6 meters)

WARNING: The SCSI port uses the same type of connector as a standard RS-232, DB-25 serial interface, but it is different electrically. Do not connect any RS-232 device to this connector. Doing so can result in damage to both the device and the Macintosh LC.

Modem and Printer Ports

Pin Signal name Signal description

1 HSKo Handshake out

2 HSKi Handshake in/external clock

3 TXD- Transmit data -

4 GND Signal ground

5 RXD- Receive data -

6 TXD+ Transmit data +

7 GPi General purpose input*

8 RXD+ Receive data +

*Modem port only. Can be set in software to be a second external clock.

- Connector type: 8-pin minicircular

Disk Drive Port

Pin Signal name Signal description

1 GND Signal ground

2 GND Signal ground

3 GND Signal ground

4 GND Signal ground

5 -12v -12 volts DC

6 +5v +5 volts DC

7 +12v +12 volts DC

8 +12v +12 volts DC

9 NC No connection

1 PWM Motor speed control

11 PH0 Register select CA0

12 PH1 Register select CA1

13 PH2 Register select CA2

14 PH3 Register write strobe LSTRB

15 WRREQ/ Write request

16 SEL Register select line SEL

17 ENBL/ Drive enable

18 RD Read data

19 WR Write data

- Connector type: DB-19

Audio Jack for the Macintosh SE

Pin Signal name Signal description

(Sleeve) GND Signal ground

(Tip) AUDIO .5 volt peak-to-peak

audio signal

- Connector type: Miniature mono phone plug

- The internal speaker is disabled when this port is in use.

Audio Jack for the Macintosh SE/30

Pin Signal name Signal description

(Sleeve) GND Signal ground

(Ring) RIGHT .75 volt peak-to-peak audio
signal, right channel

(Tip) LEFT .75 volt peak-to-peak audio
signal, left channel

- Connector type: Stereo miniature phone plug

- The internal speaker is disabled when this port is in use.

Apple III Hardware: 12-volt Confidence RAM Test

This article has been archived and is no longer updated by Apple.

A Confidence RAM Test for Apple IIIs is on the Confidence Disk and the Dealer Diagnostic Disk. With this test, you can locate bad chips on a 12-volt board.

--> NOTE: Before running the Confidence RAM test, remove all peripheral cards from the Apple III, especially any ProFile interface cards and Grappler printer cards.

The test results show the bank, address, and test expectations and actual performance. For example, after the test, say the console displays:

BNK 82, ADR 67AF, EXP 40, GOT 48.

To locate the bad chip, you must translate these results into a map that corresponds to the 3 banks of 16 chips on the memory board.

1. The bad chip is in bank 2. The bank number comes from the last digit of the BNK field.

BANK: 0 x x x x x x x x x x x x x x x x
BANK: 1 x x x x x x x x x x x x x x x x
BANK: 2 X X X X X X X X X X X X X X X X

2. The bad chip is in the right side of the bank. The side is determined by the range that the address, 67AF, the number in the ADR field, falls into.

ADDRESS RANGE: ADDRESS RANGE:
2000-3FFF 4000-7FFF
8000-9FFF
BANK 0 x x x x x x x x x x x x x x x x

ADDRESS RANGE: ADDRESS RANGE:
0800-0FFF 0000-07FF
1800-1FFF 1000-17FF
C000-C7FF A000-BFFF
D000-D7FF C800-CFFF
E000-FFFF D800-DFFF
BANK 1 x x x x x x x x x x x x x x x x

ADDRESS RANGE: ADDRESS RANGE:
2000-5FFF 6000-9FFF
BANK 2 x x x x x x x x X X X X X X X X

3. The bad chip is in location number B5. The bad chip shows up in the comparison of the binary representation of the hexidecimal values in the fields EXP and GOT, which contain the test expectations and performance. Any difference between the two is a map of where to find the bad chip or chips.

hexidecimal binary hexidecimal binary hexidecimal binary

0 0000
1 0001 6 0110 B 1011
2 0010 7 0111 C 1100
3 0011 8 1000 D 1101
4 0100 9 1001 E 1110
5 0101 A 1010 F 1111

EXP = 40 (hexadecimal) = 01000000 (binary)
GOT = 48 (hexadecimal) = 01001000 (binary)

EXP = 40 (hexadecimal) = 0 1 0 0 0 0 0 0 (binary)
GOT = 48 (hexadecimal) = 0 1 0 0 1 0 0 0 (binary)

ok ok ok ok ! ok ok ok

ADDRESS RANGE:
6000-9FFF

BANK 2 x x x x x x x x x x x X x x x

In the chip location number B5, the letter comes from the letter of the banks of chips on the memory board:

LETTER: D
BANK: 0 x x x x x x x x x x x x x x x x

LETTER: C
BANK: 1 x x x x x x x x x x x x x x x x

LETTER: B
BANK: 2 x x x x x x x x x x x X x x x

The number comes from the number of the chip on the memory board:

NUMBER: 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2
LETTER: D x x x x x x x x x x x x x x x x (BANK 0)
C x x x x x x x x x x x x x x x x (BANK 1)
B x x x x x x x x x x x X x x x (BANK 2)

Replace the bad memory chip(s) and run the test again. If the system fails the memory board test, exchange the memory board itself. If that dosen't help, exchange the main logic board.

Newton MessagePad: How to Add Words to the Word List

- **Last Modified:** January 16, 1998
- **Article:** TA29943

- **Old Article:** 12953

How do I add words to Newton's word list?
You can add words to Newton's word list with Newton's on-screen keyboard. Here are two ways to do that:

1) Double-tap words that Newton misinterprets. This will display the on-screen keyboard. Type in the correct word with your stylus, then tap Yes when Newton asks you if you want the word added to your personal word list.

2) Tap the keyboard icon inside the Preferences Menu or on the bottom left of the Note Pad to display. When the keyboard is displayed, type in the desired word with your stylus, then tap Add to add your word to the word list.

Only add words to your personal word list that you use often. Try not to add many short words, abbreviations or acronyms to the list, because it will slow down Newton's interpretive process and increase the likelihood of future mistakes.

If Newton seems to continuously misinterpret specific letters or words, you may want to go back to Letter Styles in the Preferences Menu and narrow or expand the styles you want Newton to recognize.

Macintosh: Using High-Density Disks in 800K Drives (01/95)

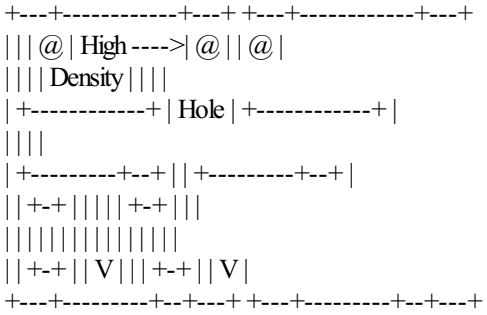
This article describes how to use a 1.4MB high-density disk in an 800K drive.

This article has been archived and is no longer updated by Apple.
If you take brand new high-density, "preformatted for Macintosh" floppy disks and copy some files off an earlier model Macintosh (such as a Macintosh Plus) to transfer them to a newer model Macintosh (such as a Performa). When you insert the disk in the newer model's drive, you get the message "This disk is unreadable. Do you want to initialize it?"

This happens because you are using high-density disks to perform your file transfer, but the earlier Macintosh and the newer Macintosh do not use the same type of disk drive. The earlier models, along with most original Macintosh II models and some Macintosh SE systems do not have the high-density SuperDrive (or FDHD ð floppy drive, high density) necessary to read and format a high-density disk.

So, if you insert a blank high-density disk in a double-density (800K) drive like the one in a Macintosh Plus, it does not know the difference between a double- density and a high-density floppy, and happily formats your expensive 1.4MB disk as an 800K disk.

When you move this disk to a Macintosh with a SuperDrive, the newer drive recognizes the disk as a high-density floppy by its extra hole. Since the disk has been formatted as 800K instead of as 1.4MB, the SuperDrive misreads it and asks you if you want to initialize it.



As a temporary workaround, place a small piece of tape over both sides of the extra hole (the one on the upper left when looking at the diskette from the front, as shown in the above diagram) on the high-density disk to trick the Macintosh into treating the disk as a double-density disk. This is a temporary solution, and the tape should be removed and the disk reformatted to the proper size as soon as possible.

Article Change History:
13 Jan 1995 - Added keyword, retitled, and made several technical updates.

Macintosh: Possible Cures for Jumpy Mouse Pointer

- **Last Modified:** October 04, 2008
- **Article:** TA29956

- **Old Article:** 12970

This article has been archived and is no longer updated by Apple.

My mouse pointer jumps all over the screen now, but it used to glide smoothly. What happened?
A jumpy mouse pointer is usually indicative of a loose cable. To check it, power your computer off, unplug and replug the cable into your computer, then restart.

If the jumpiness persists, the small rollers inside the mouse may be dirty. Remove the mouseball retaining ring by turning it counter-clockwise one quarter turn. The retainer will pop off and the mouse ball will come out.

Check the black rollers for contamination. If you notice a buildup of dirt on the rollers, clean them with your fingernail or other non-metal tool. The mouseball should also be cleaned periodically to ensure it will roll smoothly and grip the rollers inside the mouse. Use a soft rag and water or a mild soap to clean the ball. Rinse it thoroughly before reinstalling it into the mouse.

If the mouse continues to act up, it may be in need of replacement. Try the mouse on another computer, or try a different mouse on your computer to determine where the fault lies. Contact your local Apple Authorized Service Provider for a replacement mouse.

Refer to TIL article 6491: "**How to Clean a Mouse**" for complete instructions on cleaning Apple mice.

Apple II, II+, IIe, IIc: ASCII characters, values & keystrokes

The following table contains the ASCII codes generated by pressing a key or combination of keys on the Apple II, Apple II Plus, Apple IIe, Apple IIc, and Enhanced Apple IIe.

This article has been archived and is no longer updated by Apple.

The character names come from the American Standard Code for Interchange of Information. Certain peripherals or programs or functions, such as the BASIC function CHR$, may require the decimal values; certain peripherals or programs may require the hexadecimal values as well.

The fourth column in the table below is for simple keystrokes or those made with the SHIFT key held down; the fifth and sixth columns are for those made either with the CTRL key held down or with both the SHIFT and CTRL keys held down simultaneously.

NOTE: An asterisk next to keystrokes or character names means that the Apple II and Apple II Plus can't generate that charcter from its keyboard. The double asterisk indicates a special case.

The comments column defines the non-printing ASCII characters.

			Keystrokes	Holding down:		Comments
Char	Dec	Hex	Regular	CTRL	SHIFT-CTRL	
NUL	00	00			@ **	null character
SOH	01	01		a	A	start of header
STX	02	02		b	B	start transmission

Macintosh: Troubleshooting a Rejected Disk

- **Last Modified:** January 20, 2000
- **Article:** TA29966

- **Old Article:** 12982

I keep getting a message saying, "This is not a Macintosh disk: Do you want to initialize it?" or "This disk is damaged: Do you want to initialize it?"I know the disk had already been formatted for a Macintosh and I have not had problems with it before. What is wrong now?
When you get these messages and you are certain the disk is properly formatted, click No. If you click Yes, all the data on the disk is overwritten by the Macintosh and lost.

Immediately lock the disk. This protects your data in case the problem is a damaged directory or misaligned drive; both of these problems can cause your data to be erased from an unlocked disk.

What to Look For
If you are using a Macintosh Quadra 660AV or Quadra 840AV, your disks could be rejected because these models use a different floppy disk controller which reads and writes data more precisely than the one in most other Macintosh computers. It may not be able to read your disk, especially if it was manufactured by a mass-duplication process. If this occurs with software installation floppy disks, contact the vendor for another copy of the software.

NOTE: This problem can occur if composite SIMMs are installed in your machine. Confirm that any additional RAM added is non-composite. Apple only supports non-composite SIMMs. If you are not sure whether you have composite SIMMs, read the Technical Information Library article titled, "Composite SIMMs: How to Identify."

1.4 MB High-Density Disks
If the disk is a 1.4 MB high-density disk and the drive can only read 400K or 800K disks (Macintosh computers before and including the Macintosh Plus, the original Macintosh II models, and some Macintosh SE models), it cannot be read by anything other than a SuperDrive (FDHD, or floppy drive, high density).

High-Density Disks
If the disk is a high-density disk that was formatted as an 800K disk, your drive gives you a message like "This disk is improperly formatted for this drive. Do you want to initialize it?"

The best option in this case is to remove the disk and reinsert it in an 800K drive. However, if no 800K drive is available, you can trick the drive by putting tape over the hole in the upper-left corner of the disk (be sure to cover both sides of the hole).

Save any information you need from the disk onto the hard drive, eject the disk, remove the tape, and reformat the disk as soon as possible.

NOTE: Use this technique only for emergencies.

Putting tape or any other item that could come off in the floppy drive can damage your computer.

Try the disk in another drive
If it works properly, this may indicate that one of the drives is misaligned or broken. When a disk that was written on by one drive cannot be read by another, the heads on one of the drives is out of alignment. The drive that is misaligned or broken may not be the drive that cannot read the disk; try the disk in three or four drives to identify the drive with the problem.

Warm or Cold Disks
If the disk is too warm or too cold, the drive may not be able to read it properly.

You can warm up a cold disk safely by setting it on top of your monitor for a few minutes. An overly warm disk can be cooled by placing it in a shady, cool place. DO NOT attempt to heat or cool a disk in an oven or refrigerator.

Damaged Disks
If none of these resolves or identifies the problem, the disk is damaged. You can attempt to make a copy of unreadable or damaged disks using a disk recovery software program (like MacTools FastCopy by Central Point Software), then try fixing the problem using a repair utility.

The first utility to try would be Disk First Aid which is included on one of the System disks (Utilities or Disk Tools) that came with your Macintosh computer. If it

does not completely repair the problem, try running Disk First Aid several times. If Disk First Aid cannot fix the problem, there are many other recovery utilities you can try.

Other repair or recovery utilities may do more complex repairs than Disk First Aid. You might try one of these utilities for severely damaged disks. You might at least be able recover some of your data. Some examples of these utilities include Norton Utilities by Symantec or MacTools Deluxe by Central Point Software.

Other Disk Formats
If you are using MS-DOS or ProDOS formatted disks, you must have the PC Exchange control panel installed and have a High-Density drive installed in your Macintosh computer. While your macintosh computer can read both ProDOS and MS-DOS disks, you should still use only Macintosh formatted disks if you are not exchanging files between Apple II or MS-DOS computers.

There is an additional step you may have to perform if you are using MS-DOS or ProDOS formatted floppies. You may have to throw away the PC Exchange Preferences file. It is located in the Preferences folder within the System Folder. If this file has become damaged, you may no longer be able to mount MS-DOS and ProDOS formatted disks. Once you have removed the PC Exchange Preferences file, a new one is created the next time you start your computer.

This article provides information about some non-Apple products. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

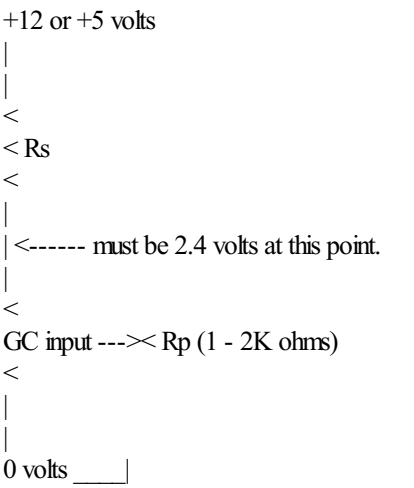
Apple III: Game Paddles

Standard Apple II 150K game paddles cannot be used with the Apple III. A high impedance potentiometer like the Apple II paddle will not work properly connected to an Apple III port.

This article has been archived and is no longer updated by Apple.

The analog inputs on Port A and Port B of the Apple III are designed to read a voltage between 0 and 2.4 volts and convert it to a number between 0 and 255. The schematic on page 82 of the Apple III Owner's Guide is drawn for a joystick with 5,000 ohm potentiometers. Only the bottom 20% of the potentiometer's range is used. Using the +12 volt power supply will result in the most stable readings.

The following circuit can be used if the entire range of the potentiometer is desired.



The voltage range at the GC inputs should go from 0v to 2.4v. The value of Rs can be calculated for +5 volt systems with this formula:

Rs = Rp * 2.6 / 2.4

For +12 volt systems use: Rs = Rp * 9.6 / 2.4

Last Modified: Feb 19, 2012

Archived - Retrospect: Error Messages (1 of 2)

This article list the following Retrospect error messages and possible solutions.

1) Catalog out of sync
2) Bad StorageSet header
3) Content Unknown
4) Content Damaged
5) Compare Error
6) Error 34 (volume full)
7) Errors 35 and 53 (volume doesn't exist, volume off-line)
8) Error 36 (I/O error)

For more information on Retrospect error messages, see article 13002: "**Retrospect: Error Messages (2 of 2)**"
This article has been archived and is no longer updated by Apple.

1) Catalog out of sync Error
Each time Retrospect performs a backup to a StorageSet, it updates the information in the Catalog.

* A "Catalog out of sync" error indicates that Retrospect was unable to update the Catalog the last time it copied data to this StorageSet -- possibly because of equipment failure or power failure.

* This error may also be caused by a full disk error (error -34) or by an out of memory error (error -108). (Both of these errors are explained in separate articles in the Tech Info Library.)

What to do:
Repair the Catalog. For instructions, see "Updating a Catalog" on page 162 of the Retrospect User's Guide. If updating the Catalog does not eliminate the "Catalog out of sync" error, the Catalog cannot be repaired.

You have three options:

* Perform a Full Backup, resetting the Catalog and erasing the tape.

* Select Catalogs from the Configure icon. Choose the StorageSet and select Media Control. Click Skip, forcing Retrospect to use a new piece of media for the next backup.

* Create a new StorageSet and begin a new backup.

2) Bad StorageSet header Error
Each file in your StorageSet is preceded by a header that contains information such as its name and size. A bad StorageSet header error will appear if Retrospect reads a header that is obviously damaged or invalid.

What to do:
If the error appears immediately while you are recreating a Catalog file, it means you forgot to tell Retrospect that the StorageSet was encrypted. If the error appears during backup or retrieving, it can indicate SCSI communication issues. See "SCSI problems" on page 180 of the Retrospect User's Guide for details.

3) Content Unknown Error
A "Content Unknown" error means that Retrospect can see data on your media, but the data is not recognized as Retrospect-formatted data. For tapes, this usually means that the tape was damaged or used by a different backup program.

4) Content Damaged Error
The "Content Damaged" error message appears if you change the name of a disk or cartridge that is part of a Disk StorageSet.

What to do:
If you want to preserve this data, rename the disk to the original name it was given by Retrospect. The original disk uses the format "1-The StorageSet." If you do not want to save the data and want to use the disk for other purposes, erase the disk using the Erase Disk command from the Special menu in the Finder.

5) Compare Error
A compare error appears if a backup file does not match the file from which it was copied. Retrospect will try to back up the file again during the

next backup session.

The following messages in Retrospect Log indicate a compare error:

* File "Home": different modify date/time
* File "My File": didn't compare at data offset 263,078
* File "My File": didn't compare at resource offset 731,429

What to do:
If you know the file was in use at the time the backup occurred, a compare error is usually nothing to worry about. It simply means the file changed between backup and verification. Compare Errors that mention data or resource offsets usually indicate SCSI communication issues. See "SCSI problems" on page 180 of the Retrospect User's Guide for details.

6) Error 34 (volume full)
Error 34 (volume full) means that a volume has run out of free storage space. You will see this error in the following situations:

* If you are restoring more files to a volume than will fit.
Solution: Try restoring fewer files, or restore to a larger volume.

* When Retrospect is updating a StorageSet Catalog during a backup and the volume where the Catalog is located runs out of room.
Solution: Check your hard disk to see if it is full, or close to full.

* If you are backing up to a Macintosh File StorageSet and the destination volume runs out of free space.
Solution: Check the hard disk containing the Catalog file, to see if it is full.

7) Errors 35 and 53 (volume doesn't exist, volume off-line)
The Errors 35 and 53 (volume doesn't exist, volume off-line) mean that Retrospect cannot find a volume when it is time to perform a backup.

What to do:
Make sure the volume is actually connected to the Macintosh and that it is mounted on the Desktop. If it is, click the Immediate icon in the Retrospect Directory, then click View to scan the volume and display the Browser.

8) Error 36 (I/O error)
When an Error 36 (I/O error) is reported by Retrospect, a media issue has occurred on a source volume.

What to do:
Try verifying the media on your source disk using a disk utility or the formatting program that came with your hard drive. If you are using an Apple hard disk, try using the Test command in the Apple HD SC Setup utility or MacCheck (MacCheck is included with Macintosh computers after July 1993, and on the Macintosh Software Utility Update 1.0 disk).

If you have a Power Macintosh with the native version of Retrospect 2.1i installed, and while Retrospect displays a dialog that says "Scanning...." you encounter this error, contact Dantz.

Note: For further information on working with Retrospect and Retrospect A/UX, search the Tech Info Library by "Retrospect" or "Remote."

Archived - Retrospect: Error Messages (2 of 2)

This article list the following Retrospect error messages and possible solutions.

1) Error 43 (file not found)
2) Error 54 (file busy/locked)
3) Error 102 (trouble communicating)
4) Error 108 (out of application memory)
5) Error 203 (hardware failure)
6) Error 205 (lost access to storage media)
7) Errors -24201 (chunk checksum failed) and -25040 (Catalog invalid or damaged)
8) Error 24062 (limited to 32000 files/folders)

For more information on Retrospect error messages, see article 13001: "**Retrospect: Error Messages (1 of 2)**"
This article has been archived and is no longer updated by Apple.

1) Error 43 (file not found)
Error 43 (file not found) in Retrospect means that someone moved or deleted one or more files and folders on the target Macintosh while a backup or compare operation was in progress.

What to do:
Try backing up again. If this error continues to occur, run Apple's Disk First Aid, or another commercial disk checking utility on the disk in question.

2) Error 54 (file busy/locked)
There are two causes for Error 54 (file busy/locked):

* You are trying to back up System files using System 7 file sharing or AppleShare.
* Another application, such as FileMaker or 4th Dimension, had the files open, preventing Retrospect from accessing them.

What to do:
Back up the busy files from the local Macintosh, quit the application that owns the busy file, or install Retrospect Remote and back up the files.

3) Error 102 (trouble communicating)
Error 102 (trouble communicating) occurs when the Macintosh loses contact with the backup device. The most common cause is improper SCSI termination.

What to do:
Refer to the following information on SCSI issues below:

Troubleshooting SCSI Issues
If the Macintosh SCSI chain is not set up properly, communication errors may occur that can cause data corruption or system failures during backup operations. This following information is designed to give you guidance when encountering SCSI issues.

Some devices such as scanners, CD-ROM drives, or external SCSI floppy drives can cause issues on the SCSI bus, especially if they are turned off. If you are experiencing SCSI communication issues, make sure that all of your SCSI devices are powered ON when you start your Macintosh.

The following sample errors can indicate communication errors on the SCSI bus:

* File "Home" didn't compare at resource offset 10,750
* File "Tech Note" didn't compare at data offset 3,253
* Trouble writing: "1-Office Backup 2" (0), error 102 (trouble communicating)
* Trouble reading: "1-Office Backup 2" (0), error 102 (trouble communicating)

The above errors can usually be traced to some failure in the SCSI configuration, whether it is termination, a particular device, cabling, or device order. The most common cause of communication issues is improper termination or bad SCSI cables.

Termination
The general rule for termination is to have only two terminators on the SCSI bus, one at the beginning and one at the end. If you have only a single device on the SCSI bus, then only one terminator is needed. Most Macintosh computers purchased with internal hard disks are internally terminated. Some SCSI peripherals come with internal termination built-in, and must be placed at the end of a SCSI chain.

For more information, refer to your Macintosh user's guide and the manual that came with your hardware device.

SCSI Cables
Communication issues can be caused by bad or loose-fitting SCSI cables. Check all cables for proper seating in each connector. The entire length of your SCSI bus should not exceed 20 feet. Whenever possible, avoid using cables over six feet in length.

Device Order and Device Conflicts
To avoid issues caused by device order or device conflicts, make sure that each device has a unique SCSI address. If issues occur, try changing the order of SCSI devices or temporarily removing unneeded devices.

For further information on working with Retrospect and Retrospect A/UX, search the Tech Info Library by "Retrospect" or "Remote."

4) Error 108 (out of application memory)
Error 108 (out of application memory) means that Retrospect needs more memory.

What to do:
Increase the memory you have allocated to Retrospect by using the Get Info command from the Finder's File menu. The following is a guide for how much memory Retrospect will need to back up large volumes:

- 1,700K for 3,500 files/folders (This is the default setting.)
- 4,000K for 10,000 files/folders
- 6,000K for 20,000 files/folders
- 8,000K for 32,000 files/folders

[BR]
If you are backing up volumes that contain a large number of files, you may need more than the recommended amount of memory.

5) Error 203 (hardware failure)
Error 203 (hardware failure) means that the tape drive is failing because of a bad tape, a SCSI issue, or a mechanical error.

What to do:
* If the error only occurs when you use a particular tape, that tape is probably damaged. Try using a new tape.

* If the error occurs when you use any tape, you may have an issue with your SCSI chain or device. Try turning off the tape drive and computer for two minutes and then turning them back on again. See article 13022: "Retrospect: Troubleshooting SCSI Issues" for more information.

6) Error 205 (lost access to storage media)
Error 205 (lost access to storage media) usually indicates that the SCSI bus was reset during a backup, causing Retrospect to lose contact with the tape. Usually this error indicates a SCSI issue and may be accompanied by an Error 102 (trouble communicating).

What to do:
If Error 102 accompanies Error 205, see article 13022: "Retrospect: Troubleshooting SCSI Issues."

If Error 102 does not accompany Error 205 and SCSI communication issues have been ruled out, the next step is to check for media failure on the source volume. Some hard disks reset the SCSI bus when they sense they are experiencing a media failure. Try testing the drive with the software that was originally used to format it.

7) Errors -24201 (chunk checksum failed) and -25040 (Catalog invalid or damaged)
Errors -24201 (chunk checksum failed) and -25040 (Catalog invalid or damaged) mean that a Catalog or other Retrospect 2.0 format file is unusable.

What to do:
If the error occurs when you are trying to back up to a particular StorageSet, you need to rebuild the Catalog for that StorageSet. After the recatalog, reselect this StorageSet in your scripts. If the error occurs when you launch Retrospect, the Retro.Configuration file may be unusable. Remove this file from the Retrospect Preferences folder and launch Retrospect again.

After you do this, you will need to recreate your scripts and other settings.

Alternatively, restore a previous copy of your Retro.Configuration file from one of your StorageSets.

8) Error 24062 (limited to 32000 files/folders)

Error 24062 (limited to 32000 files/folders) occurs if you:
* try to back up a volume that contains more than 32,000 files and folders, or
* perform a search request which finds more than this number of items.

What to do:
Partition your hard disk into two or more partitions, keeping less than 32,000 items in each partition. Or define each of the top level folders of the volume as a Subvolume.

Note: Dantz strongly recommends that you store fewer than 32,000 files on any single volume, both for Retrospect compatibility and because the Macintosh file system becomes less stable with this many files on a single volume.

Note: For further information on working with Retrospect and Retrospect A/UX, search the Tech Info Library by "Retrospect" or "Remote."

This article describes how to troubleshoot SCSI issues when using Retrospect.

SCSI Issues

If the Macintosh SCSI chain is not set up properly, communication errors may occur, when using Retrospect, that can cause data corruption or system failures during backup operations. This section is designed to give you guidance when encountering SCSI issues.

Some devices such as scanners, CD-ROM drives, or external SCSI floppy drives can cause issues on the SCSI bus, especially if they are turned off. If you are experiencing SCSI communication issues, make sure that all of your SCSI devices are turned on when you start your Macintosh.

The following sample errors can indicate communication errors on the SCSI bus:

* File "Home" didn't compare at resource offset 10,750
* File "Tech Note" didn't compare at data offset 3,253
* Trouble writing: "1-Office Backup 2" (0), error 102 (trouble communicating)
* Trouble reading: "1-Office Backup 2" (0), error 102 (trouble communicating)

The above errors can usually be traced to some failure in the SCSI configuration, whether it is termination, a particular device, cabling, or device order. The most common cause of communication issues is improper termination or bad SCSI cables.

Termination

The general rule for termination is to have only two terminators on the SCSI bus, one at the beginning and one at the end. If you have only a single device on the SCSI bus, then only one terminator is needed. Most Macintosh computers purchased with internal hard disks are internally terminated. Some SCSI peripherals come with internal termination built-in, and must be placed at the end of a SCSI chain. For more information, refer to your Macintosh user's guide and the manual that came with your hardware device.

SCSI Cables

Communication issues can be caused by bad or loose-fitting SCSI cables. Check all cables for proper seating in each connector. The entire length of your SCSI bus should not exceed 20 feet. Whenever possible, avoid using cables over six feet in length.

Device Order and Device Conflicts

To avoid issues caused by device order or device conflicts, make sure that each device has a unique SCSI address. If issues occur, try changing the order of SCSI devices or temporarily removing unneeded devices.

Macintosh Serial Port: Maximum Speed

It appears that the maximum speed that I can drive the Macintosh serial port is 9600 bps when also communicating to a printer or other AppleTalk device.

I need to drive the modem port at 19.2 kbps while communicating to a AppleShare file server. The Macintosh cannot keep up with the DEC terminal server under the above circumstance. Is there any test data that would confirm or debunk my observation?
This article has been archived and is no longer updated by Apple.
This article addresses Macintosh computers slower than the Macintosh IIfx. For those systems, the information from the following "d e v e l o p" magazine article presented is accurate.

For 68040 and PowerPC based desktop Macintosh computers, the limit is higher. While no official testing has been done to identify the exact limit of each platform, customers have reported error-free 14.4kbps, 19.2kbps, and 28.8kbps connections with simultaneous LocalTalk connectivity.

All 68030 based Macintosh PowerBook computers are impacted by the 9600bps limit. The 68040-based PowerBook computers have a higher limit (56.6kbps) and customers have reported successful 28.8kbps connections with simultaneous LocalTalk connectivity.

Maximum communication speeds of the Macintosh Serial Ports are limited when both ports are used simultaneously.

What follows is an article from issue 9, Winter 1992 (pages 86-88), of "d e v e l o p - The Apple Technical Journal."

Question: When my hardware device sends data to a Macintosh at 57.6 kbps, characters can get lost if LocalTalk is on and a file server is mounted. Does Apple know about the problem? Is there a solution?

Answer: The specification for the top speed of the serial port on a Macintosh is an absolute maximum given that no other processing or use of the SCC are present. Although the speed of the Macintosh IIfx has now allowed this ceiling to be reached in the presence of other processing, it is just not attainable on other models of the Macintosh except when the machine is dedicated to this purpose.

While AppleTalk remains active there is no guarantee on serial port data transmissions over 2400 bps. The same processor must handle the OS, the Serial driver and the AppleTalk driver (with no advantage of DMA), so the overhead is considerable. Because of the AppleTalk driver's considerations for incoming serial data, users can usually work at up to 9600 bps without any problems. All models in the current product line, except the Macintosh IIfx, are unable to sustain throughput with baud rates beyond 19.2 kbps except when exclusively dedicated to that task.

There is essentially no way to guarantee 100% serial data acquisition when using AppleTalk. This is due to the fact that while the Macintosh is receiving an AppleTalk packet, interrupts are disabled for the duration of packet transmission. What this means in a "worst case" situation is that a 603-byte packet (the largest possible AppleTalk packet) sent to the serial port would take approximately 26 milliseconds to receive. Compare this with asynchronous serial data transmitted at 9600 bps which would only take 1 millisecond to receive. A very realistic situation arises in which 26 bits could be lost during a concurrent AppleTalk/Serial Device transmission. The possibility is further strengthened when there are routers on the network, which send out large RTMPs (Routing Table Maintenance Packets).

To alleviate possible data loss, the AppleTalk driver interrogates the serial port at key times that won't interfere with packet reception. However, the checks are not at regular intervals; they are encoded in the driver as stated above. This means that these random checks may not coincide with the demands of the serial driver, and an occasional character is lost.

This same loss of characters may also occur in conjunction with the Sony driver. If a disk is inserted and it requires special attention (like formatting) then the odds of losing characters is increased. The Sony driver has built-in considerations like the AppleTalk driver (although not as frequent). So you can still lose data at high transfer rates if a disk is inserted during the transfer.

The character dropout also occurs on systems which are not currently running AppleTalk but are receiving serial transmissions from high-speed devices (57.6 kbps) and are performing CPU tasks which require a high amount of memory access (such as a CPU like the Macintosh IIsi or IIci running on-board video in 8-bit mode, or a CPU using VM).

There is, however, a way to ensure reception of high-speed serial data without character lossthrough the use of a Serial NuBus card or other third-party NuBus cards with a dedicated processor necessary to provide higher speeds. The cards in essence operate as dedicated port-handling circuitry. They are able to perform necessary buffering while the processor is servicing other interrupts. This is the reason that network cards such as EtherTalk and TokenTalk can accomplish lossless transactions; they do at least some of their own buffering until being serviced to avoid interference with other operations like receiving serial data.

Alternatively, you may want to develop a custom card yourself that exactly fits the needs of your product. In this case you should look into the Macintosh Coprocessing Platform (MCP) and Apple / Real-time Operating System Environment (A/ROSE) as a basis of this line of development. Development packages for both these products are available from APDA.
